1 INTRODUCTION AND CONTEXT

1.1 BACKGROUND

The **Airport Authority Hong Kong** ("AAHK") is responsible for operation of the Hong Kong International Airport (HKIA). The HKIA Master Plan 2030 (MP2030) recommended expansion of HKIA into a three-runway system (3RS) ("the Project") as the best way forward to cope with the projected increase in air traffic demand and to secure the continual growth of HKIA operation for the benefit of the economic development of Hong Kong. This development option for HKIA received approval in principle from the Government of the Hong Kong Special Administrative Region (HKSAR) on 20 March 2012.

An Environmental Impact Assessment (EIA) Study Report for the Project was prepared in accordance with the study brief requirements (ESB-250/2012) issued by the Environmental Protection Department (EPD). The EIA Report for the Project (Register No. AEIAR-185/2014) was approved by the EPD on 7 November 2014 and the Environmental Permit (EP) (EP No. EP-489/2014) granted on 7 November 2014.

According to Environmental Permit (EP-489/2014) Condition 2.18, the AAHK shall 'no later than 3 months before the commencement of construction works on the formed land of the Project'…submit a…''Landscape and Visual Plan (L&V Plan)…to specify quality criteria on the overall landscape and visual environment of the Project with broad-brush targets to be achieved for greening and planting as benchmarked against international standards and best practises….The L&V Plan shall include at least the following information:

- aesthetic architectural designs for building structures and facilities;
- locations, size, number and plant species of trees to be transplanted and their final transplanting locations;
- locations, size, number and plant species to be felled;
- locations, size, number and plant species to be provided or compensated; and
- implementation programme, maintenance and management schedules."

1.2 *OBJECTIVES OF THE LANDSCAPE & VISUAL PLAN*

This L&V Plan submission is prepared in fulfilment of Specific Condition 2.18 of Environmental Permit (EP-489/2014) and sets out to:

- Specify quality criteria on the overall landscape and visual environment of the Project with broad-brush targets to be achieved for greening and planting as benchmarked against international standards and best practices;
- Describe the architectural design for building structures and facilities and show how they meet the broad-brush targets and mitigation measures set out in the EIA;
- Describe the proposals for massed tree transplantation, felling and compensation to show how the broad-brush targets and mitigation measures set out in the EIA are being achieved; and
- Set out the implementation, maintenance and management schedule so that it is coordinated effectively and in accordance with measures set out in the EIA.

The L&V Plan submission is required no later than 3 months before the commencement of construction works on the formed land of the 3RS Project (see ***Section 1.1*** above). To fulfil this commitment, a preliminary L&V Plan was formally submitted to EPD on 28 December 2018, 3 months in advance of the construction commencement on formed land. The early submission required by EP Specific Condition 2.18 has presented challenges in terms of ability to provide required L&V content in sufficient detail due to the detailed design process for relevant 3RS facilities, infrastructure and landscaping design not yet being completed (noting the 3RS project is scheduled to commence operations in 2024).

Thereafter, an Initial Revised L&V Plan was submitted to EPD on 18 January 2021 to update the detail provided in the December 2018 preliminary submission and was based on design information and planning details available at the time of preparation.

This Final L&V Plan captures the completed 3RS buildings and infrastructure detailed designs and associated landscaping design. The Final L&V Plan includes relevant updates to the information presented in the Initial Revised L&V Plan as well as other additional details, not limited to the following:

- Presentation of appropriate landscape and visual details for the 3RS Project, including conceptual plans/ drawings and photomontages on general greening and design arrangements for the Terminal 2 (T2) Expansion, the Terminal 2 Concourse (T2C) (previously known as the Third Runway Concourse) and for other representative buildings and facilities (e.g. showing site area, site

coverage, disposition of buildings and building height where appropriate) as well as overview details on committed 3RS Project L&V mitigation measures.

- Updated presentation of visual aspect details not limited to:
  - Detailed conceptual plans/ drawings, photomontages illustrating/ identifying the landscape and visual mitigation measures of the 3RS Project;
  - Perspective drawings and photomontages demonstrating the aesthetic architectural designs of T2 Expansion and T2C with the detail presented emphasising the interface between external and surrounding landscapes;
  - General depiction of greening and design arrangements for representative structures in addition to the T2 Expansion and T2C;
  - Location and details of internal landscapes within buildings; and
  - An overall Key Plan for the whole 3RS project area including relevant information on the proposed mitigation measures in the Master Landscape Plan

- A full update including illustrations on greening measures and their extent across the 3RS Project, not limited to greening of external areas such as airside turf greening, roadside and amenity planting, and other greening area details such as at grade greening and internal space greening, roof top greening, screen and indoor planting;

- A full update on status of achievement of landscape and visual mitigation measures including an overall mitigation measures plan and relevant blow outs (with appropriate scale) to better identify relevant mitigation measures; and

- A full update on tree management aspects including details on tree compensation such as tree species, quantity, planting locations, plant spacing and soiling detail as appropriate.

1.3 SCOPE OF THE FINAL LANDSCAPE AND VISUAL PLAN

The site area for 3RS Project landscape and visual aspects matches the area captured in the "Landscape and Visual Mitigation Arrangement Plan – CLK" (Figure MCL/P132/EIA/15-028.1 (Rev.C)) as presented in the EIA. The specific focus of EIA / EP landscape and visual mitigation measures and commitments extends to the new reclaimed land area (covering the Western Support Area (WSA), Eastern Support Area (ESA), the T2C, the Apron and new Airfield areas), the T2 Expansion and the associated APM and BHS infrastructure developments on the existing airport island and the centre runway area.

The anticipated road alterations identified for the existing southern cargo area and in the western area of the existing airport are not under planning at this time and

associated L&V commitments for these areas are not considered further in this plan. ***Figure 1.1*** "Coverage of 3RS Key Project Components" defines the focus area of the 3RS Project L&V effort.

The new 3RS airfield areas and many of the associated 3RS Project ancillary buildings, facilities and supporting infrastructure have limited potential for the incorporation of significant landscape and visual elements into their designs, principally because of the functional nature of airport facilities and supporting infrastructure in the operational airport setting. Nonetheless, relevant landscape and visual elements are also included for representative ancillary buildings to provide complete coverage of new facilities and infrastructure.

The T2 Expansion on the existing airport island and the new T2C on the newly formed land area are the key 3RS developments with significant aesthetic architectural design opportunities. These major 3RS Project buildings are therefore the main focus of **Chapter 3** of this plan and substantive details are included on aesthetic architectural designs for these key building structures and associated facilities. **Chapter 4** focuses on the treatment of trees and tree management across the 3RS Project as a whole. **Chapter 5** provides details on the implementation of the landscape and visual mitigation measures in the form of an implementation schedule.

1.4 STRUCTURE OF THIS FINAL LANDSCAPE & VISUAL PLAN

The structure of the Final L&V Plan is as follows:

Chapter 1 - Introduction and Context

Chapter 2 - Design Codes and Standards – Including the Local Regulatory Framework, information regarding International Benchmarking and the Recommended Design Quality Criteria and Broad Brush Targets.

Chapter 3 - Provides a detailed description of the aesthetic architectural designs for building structures and facilities, focusing on the T2 Expansion, the T2C and associated ancillary buildings and facilities.

Chapter 4 - Provides detailed information on the Project's treatment of trees, including trees being retained, transplanted or felled along with compensatory tree planting detail in accordance with Initial Landscape and Visual Plan submitted on 18 January 2021. The implementation program is also covered, including maintenance and management schedules.

Chapter 5 - Outlines the landscape and visual mitigation measures to be implemented, including the implementation agent, location, timing and status.

Annex A – Hong Kong Regulatory Framework

Annex B – International Standards & Best Practice– Airport Landscape Design

Annex C – Trees Assessment Schedule

Annex D – Generic Tree Protection Plans

Annex E – Tree Treatments Plans

Annex F– Typical Tree Transplantation Specification

Annex G – Compensatory Tree Planting Plans and Recipient Locations for Transplanted Trees

Annex H– Photo Records of “Retain” and “Transplant” Trees

2 DESIGN CODES, STANDARDS AND BENCH MARKS

This chapter sets out the legislation, codes and standards of relevance to this Plan. A comprehensive review of available and relevant international standards and/or best practices relating to the landscape and visual environment of an airport setting was also conducted, with quality criteria and broad brush targets for the Project recommended.

2.1 *RELEVANT LEGISLATION, CODES AND STANDARDS*

Annex A summarises the Hong Kong legislation, codes and standards that are of relevance to this Plan. In addition, HKIA has an established planting scheme in place; the airport island is generally divided into distinct zones according to distance from runways and land use (***Figure 2.1***), with all planting required to adhere to the Approved Plant Species List (APSL). The APSL serves as a guide for project proponents on HKIA when planting proposals are under consideration for different areas on the airport island and aims to strike a balance between aviation safety and landscape attractiveness, both within the airport boundary and in its close vicinity.

2.2 *LANDSCAPE AND VISUAL MITIGATION MEASURES FROM EIAO PROCESS*

Landscape and visual mitigation measures from the EIAO process are detailed in ***Table 5.1***, which provides a review of the Project landscape design against these landscape and visual mitigation measures, summarising how they are considered and integrated into the Project.

2.3 *INTERNATIONAL BENCHMARKS & BEST PRACTICES*

An extensive review of international standards and best practices has been conducted focusing on landscape master planning in relation to the design of airports around the world and considering other relevant information such as architectural awards and general guidelines on airport design (See ***Annex B***). Some international standards for airport environmental planning do exist, but are primarily focused on noise, air quality, greenhouse gas emissions and improving efficiency to reduce use of natural resources. In particular the International Civil Aviation Organization (ICAO) (1) includes 'Environmental Protection' amongst its five strategic objectives (2), however ICAO documents on Airport Planning and Design aspects do not include specific standards for landscape design criteria or greening. Overall the review concluded there are no

(1) ICAO is a UN specialized agency, established by States in 1944 to manage the administration and governance of the Convention on International Civil Aviation (Chicago Convention)

(2) For ICAO's Strategic Objectives, see at: https://www.icao.int/Pages/default.aspx

internationally recognised quality criteria, broad-brush targets, standards or best practices for airport landscapes, although some commonalities across aviation facilities do exist.

Since no particular international targets or broad brush targets for landscape or greening requirements have been identified that are relevant to the HKIA context, the Hong Kong regulatory framework has been carefully reviewed to determine guidance or criteria that may be relevant to the HKIA setting, given the clear need to strike a balance between aviation safety and landscape attractiveness and greening.

Sustainable Building Design Guidelines

The Buildings Department, Practice Note for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers – Sustainable Building Design Guidelines (PNAPP 152), which promulgates guidelines on building design intended to enhance the quality and sustainability of the built environment in Hong Kong, captures recommended practices for aspects including site coverage, with recommendations for greenery targets in different Hong Kong developments. In particular, PNAPP 152 identifies a general requirement for 30% greenery for developments with a site area equal to or greater than 20,000 m^2, while it also recognises there are special circumstances in which genuine difficulties in achieving such coverage may be encountered, including buildings serving special functions. In the case of the 3RS Project, the PNAPP152 requirement for 30% greenery is not practicable due to the special nature and function of the airport facility, with its significant safety considerations for aeronautical activities.

BEAM Plus

The AAHK has been awarded a Provisional Platinum rating under the BEAM Plus New Buildings (NB) standard (Version 1.2) for both the T2 Expansion and the T2C.

BEAM Plus is the leading green building initiative in Hong Kong, and uses independent, third party assessments to determine building sustainability performance, seeking to enhance the environmental performance of new buildings, while also improving user satisfaction. The BEAM Plus assessment process involves an Independent Assessor considering a comprehensive set of criteria (defined by the BEAM Society Limited - BSL) to assess sustainability performance aspects relating to planning, design, construction, commissioning, management, operation and maintenance of a building. Some of the assessment criteria are relevant to landscape and greening and these have been considered at the planning and design phases of both the T2 Expansion and T2C.

One of the BEAM Plus criteria as specified in the BEAM Plus NB Version 1.2 Manual requires that project proponents developing typical residential or commercial buildings consider landscaping up to 30% - 40% of the available site area to maximise credits. Yet, due to the special functional, security and operational needs of the T2 Expansion and T2C within the operating airport environment, it is recognized that the

stated percentage planting and greening targets are not suitable for direct application. This understanding is in line with the recognition, as discussed above, that the PNAPP 152 requirement for 30% greenery is not practicable due to the special nature and function of airport facilities.

2.4 DESIGN QUALITY CRITERIA & BROAD BRUSH TARGETS

Following the review of international standards and best practices as well as the Hong Kong regulatory framework, design quality criteria for the overall landscape and visual environment of the Project have been developed, with suggested broad-brush targets to help achieve the design quality criteria. These are set out in ***Table 2.1***. As noted in ***Section 2.3***, there are no specific, internationally recognized guidelines or standards for landscape design and greening at airports. Findings from the benchmarking review of international standards and best practice for airport landscape design (see ***Annex B***) identifies that other international airports adopt different greening and planting practices/ approach to best suit their specific and respective local environments and surroundings. No one particular approach on landscaping and greening adopted at other airports was found to fit the HKIA case, and there is no readily available template to guide the approach for the 3RS Project at HKIA. However, most of the required landscaping that is in association with the 3RS works footprint on the existing airport land area and a key landscaping aim here tie in with well-established landscape characteristics and themes in place for many years at HKIA, guided by the strict requirements of the APSL with its balance of aviation safety and landscape attractiveness.

It is important to note that the current airport island has extremely limited land availability. The airport is an intensively used site with the majority of landside areas occupied by various airport infrastructure, transport, commercial and operations support facilities. With the 3RS development further encroaching into the existing two-runway system (2RS) land areas, the available remaining areas that are suitable for greening and landscaping are extremely limited. Nonetheless, AAHK has endeavoured to include landscaping features and greenery coverage as far as practicable; the extent of greening for the area covering 3RS key project components is around 20% (refer to ***Figure 2.2*** and ***Figure 2.3*** for the coverage of 3RS key project components and greening calculation and ***Figure 2.4*** for the further breakdown of airside turf, roadside planting and amenity planting greening categories). New landscaping designs associated with 3RS development encroaching into 2RS land areas and in the numerous tree compensation areas have been coordinated to reflect the existing established landscape character and 'sense of place' of Hong Kong and the airport location.

3RS Project Greenery

The total area for which a greenery target has been calculated is defined in ***Figure 1.1*** and includes the new reclaimed land area (covering the WSA, ESA, the T2C, the Apron

and new Airfield areas), the T2 Expansion and the associated APM and BHS infrastructure developments, and associated areas on the existing airport island as well as the centre runway area.

For airport operations related projects, the International Standard and Recommended Practice, Annex 14 –on the Convention on International Civil Aviation (Section 9.4.4) mentions that any source attracting bird activity shall be prevented (i.e. in order to avoid bird hazard). Certain types of landscaping and greenery can provide food or shelter that may attract birds into the aerodrome and this may increase the risk of bird hazard, therefore the scale of soft landscaping needs to be controlled for safety reasons. This understanding is also in line with the provision in paragraph 12 of the "Special Considerations" subsection in PNAP APP-152 Sustainable Building Design Guidelines (SBDG) issued by the Buildings Department (BD). This section specifically notes that while the SBDG requires at least 30% of greenery coverage for sites with an area ≥20,000m^2, it recognizes the genuine difficulties in complying with this requirement for new buildings serving special functions, including terminals, ferry piers and stadia, etc. Excessive or certain types of greenery/ landscaping in an airport setting can have adverse impacts due to the potential for attracting bird activity, leading to potential aviation hazards.

Nevertheless, greenery areas within the coverage of 3RS key project components captured in ***Figure 1.1*** is calculated to comprise around 23% of the project footprint (refer to ***Figures 2.2*** **to** ***2.4*** for detail on the size of the entire area, greening categories and overall greening area detail) and include 3RS land reclamation green areas (e.g. airfield turf areas) and landscape areas around the T2 Expansion and the associated APM and BHS infrastructure developments in the existing 2RS land areas (e.g. roadside and amenity planting). Other greening areas, including roof top greening, screen planting and indoor planting areas, are provided in various locations of the buildings, i.e. ancillary buildings (mainly roof top greening- ***Figure 3.6***), T2 Expansion and T2C (mainly indoor plantings- ***Figure 5.3***), and compensatory tree plantings in the south cargo area (mainly for screen planting – ***Figure 3.1.3***). It is however noted that building related greening (e.g. green roofs, indoor or other similar greening) is classified as internal landscaping and is not counted towards the total 3RS Project greening percentage.

Table 2.1 Recommended Design Quality Criteria and Broad Brush Targets

#	Design Quality Criteria	Broad Brush Target
1	Create a 'sense of place' by relating the landscape design to the unique character of the site context in Hong Kong	*See information in Chapter 3 and also:* • Landscape themes respond to the specific character and site context of each of the landscaped areas (Referring to *Section 3.1- Landscape Design under T2 Expansion* and *Section 3.2- Landscape Design for the T2C*, both sections describe how desired character and theming is achieved through the landscape design.)
2	Enhance the airport's appearance through an attractive and innovative landscape setting and the creation of a welcoming gateway on arrival and departure	*See information in Chapter 3 and also:* • Landscape themes are coordinated across the different public exposure zones, with an emphasis on an exciting and attractive welcoming gateway to HKIA (Referring to *Section 3.1-Landscape Design under T2 Expansion,* the description of the planting design to create sense of arrival for visitor is adopted.*)*
3.	Maximise greening of external open space, including reclamation edge	• Target to achieve 20% green coverage as far as practicable in external open spaces. Green coverage includes airside turf planting, roadside planting and amenity planting.
4	Balance built form by connecting it to the external and surrounding landscape	*See information in Chapter 3 and also:* • Ensure interface areas between built form and the external spaces contain landscape hard and soft elements, unless otherwise justified (Referring *Figure 3.1*, *Figure 3.1.1 and Figure 3.1.2* show that the interface areas between built form and the external spaces contain landscape hard and soft elements). • Integrate building and landscape design so that there is no abrupt boundary between the two environments (See *Figure 3.1*, *Figure 3.1.1 and Figure 3.1.2* show that there is no abrupt boundary between them.).
5	Maximise internal landscapes within building structures.	• Ensure consideration has been made to integrate greening (e.g. indoor planting and within planters, etc.) within key building structures, where feasible.
6	Minimise adverse impacts on the existing landscape and visual resources	• Compensate felled trees based on a target replacement ration of 1:1 (See *Section 4.1, para 3- Tree Compensatory,* 1:1 ratio is adopted in accordance with technical circulars, in which most of the trees need to be compensated outside the works sites. Detail refer to *Table 4.2*). • • Requirement that 100% of disturbed areas (e.g. temporary works areas) shall be reinstated.
7	Select planting species that are sustainable and do not attract wildlife, are characteristic of the local micro-climate and are economically feasible and cost-effective to maintain	• Ensure the planting species comply with the Airport's Approved Plant Species List (See *Section 4.1* and *Table 4.3.* A list of tree species is provided in accordance with APSL). • Reduce potable water use for landscaping to a practical, cost-effective minimum, beyond a 12-month establishment period.

3 AESTHETIC ARCHITECTURAL DESIGNS FOR BUILDING STRUCTURES & FACILITIES

The T2 Expansion and T2C are the key elements of the 3RS Project providing the opportunity for exceptional architectural design, and these two major buildings are therefore the focus of this Chapter.

Other important buildings under development as part of the 3RS Project include ancillary buildings, facilities and infrastructure associated with an operating airport. These include airfield fire stations, ground support services equipment staging and servicing facilities, Air Traffic Control observation facilities, Civil Aviation Department (CAD) facilities, Hong Kong Observatory (HKO) facilities, stores, security gatehouses, and various other small scale ancillary buildings. The WSA and ESA will also have a number of mainly franchisee and government airport buildings supporting the operational needs of the 3RS, including a Police Operational Base, fire stations, cargo handling facilities, aircraft caterers, aircraft maintenance facilities and so on.

In general, these buildings have rather limited potential to significantly affect the Project's landscape and visual environment due to building functionality, airport height limit restrictions and very onerous limitations on planting and reflectivity in airside areas; landscape provision in the airside is limited to grass only. Nonetheless, these ancillary buildings and facilities have been designed to adopt a consistent and complementary design language, using a suitable palette of colour and finish both to complement each other and to suit individual roles and locations. Roof areas and elevations have a similar patterned visual treatment for consistency.

3.1 TERMINAL 2 (T2) EXPANSION

Terminal 2 (T2) is being expanded from a departures only facility to a full service processing terminal (serving departures, arrivals and transfer passengers) with connected functionality to the T2C. The T2 Expansion involves the construction of the T2 main building, including the basement, north and south annex buildings (CP2a and CP2b) connected by pedestrian bridges, the associated road network for connecting with existing airport facilities and utility upgrading works. The expanded T2 will comprise eight storeys with a maximum building height of 51.20mPD. The net site area of the T2 Expansion is approx. 130,138m^2, while the overall site coverage of the T2 main building within the site boundary is approximately 52.5%.

Background and Architectural Design Objectives for T2 Expansion Building Structures/Facilities

The architectural idea centres around a 'Feather' concept that is aerodynamic and reminiscent of flight. It aims to reflect and re-interpret the architectural language of Terminal 1, but with a fresh and invigorating approach. It also aims to provide a logical planning approach and intuitive orientation benefit for the passengers with its strong east/west directionality.

The new T2 development has been designed to provide an architectural response to the existing adjacent airport buildings such as Terminal 1 and the Ground Transportation Centre. There are access road systems at ground level providing entrances and exits from the covered coach station, carparks, HKIA Tower, and HKIA Commercial Building. The building external facades have a hierarchy of finish and colour. At ground level, darker tone grey provides a heavier visual base with lighter tone metallic silver cladding and louvres then applied to the upper podium floors. The Check-in Hall is enclosed by full height glazing allowing natural light into the public areas and views out in all directions. The main roof has a gently undulating geometry echoing the directionality of Terminal 1 and the baffled ceilings respond to this geometry – gently rising and falling to emphasis the scale of the space. The roof edges allow the baffles to continue externally providing a visually seamless transition from interior to exterior, whilst providing solar shading to the facades. At the West elevation the roof dramatically over sails the vehicle drop off, providing rain protection and a visually exciting experience. The roof edge profiles are coloured in a subtle bronze tone providing a unique identity and quality to the shaped aluminium geometry. The exterior roof surfaces are clad in silver colour tones.

The roof is supported by slender, splayed steel columns which provide visually delicate elements within the public areas. These columns appear externally on the North and South elevations providing visual continuity.

There are a number of buildings adjacent to the main T2 building. These include new multi-storey car park facilities (Car Park 2a and Car Park 2b), vent and Trolley Recirculation structures. The architectural treatment of these is consistent with and use the same design language as T2. Enclosed footbridges link T2 with adjacent buildings such as 11 SKIES and beyond to AsiaWorld-Expo. These footbridges follow a coherent design with glazed facades and bright, airy internal spaces.

Overall this fits with the design quality criteria of creating a 'sense of place' (design quality criteria #1) and enhancing the airport's appearance (design quality criteria #2) as well as balancing built form by connecting the building with the external elements (design quality criteria #4). ***Figure 3.2 and 3.3*** illustrates some of the T2 Expansion design concepts.

Landscape Design of T2 Expansion

A holistic Landscape Masterplan has been developed for the T2 Expansion works covering the proposed building, landscape deck and departure kerb, and the planting strategy aims to create a unique arrival experience that compliments the scenic journey offered by Lantau Island to the south (design quality criteria #1, #2, #3, #4). Rhythmical landform, accentuated by shrub plantings and coloured gravel are proposed that integrates with the viaduct structure to soften the visual impact of the engineering infrastructure. Overall, the delicate arrangement of the planting layout aims to create a compelling visual stimulation and enhance the sense of arrival for visitors (design quality criteria #2). Planting layouts are carefully arranged to respond

to the speed of travel and the spatial planning of buildings and road works (design quality criteria #4).

Overall, the landscape design for T2 Expansion can be categorized into areas with relatively higher or lower exposure (visually or physically) to visitors. For soft landscape works, the planting species are selected in accordance with the HKIA APSL (design quality criteria #7) as well as their suitability and adaptability to their planting location and their association with adjacent species to create the desired visual effect (design quality criteria #7).

External areas with high exposure to visitors include the departures drop off, arrival kerb area, landscaped flat roof areas, and the new landscaped decks at the Airport Authority's offices HKIA Tower (HKIAT) and HKIA Commercial Building (HKIACOM). Soft landscape treatment in these areas visually enhances edge treatment of terrace structures (design quality criteria #4), responds to the surrounding buildings/ structures to create a visually stimulating pattern and pleasant environment, and transforms certain areas into intimate spaces that might be used by office workers or visitors for leisure and passive use (e.g. a "pocket garden" on the deck at HKIAT and HKIACOM).

The BEAM Plus process requires a Provisional Assessment (PA) of buildings to determine the expected BEAM Plus rating based on confirmed designs and environmental commitments early in the project cycle. The T2 Expansion has achieved a Platinum rating at the BEAM Plus PA stage. Given that specific BEAM Plus credits for percentage planting and greening targets are not being directly applied to the T2 Expansion, an approach of seeking to maximise greenery and landscapes in areas with higher public exposure has been adopted as part of the design.

3.2 *TERMINAL 2 CONCOURSE (T2C)*

T2C is an airside passenger concourse building with full departures, arrivals & transfer functions. In the Initial Phase of the Project, the T2C will comprise seven storeys with a maximum building height of about +50mPD, with 38 contact aircraft parking positions, 28 fixed link bridges (FLB), a new Air Traffic Control (ATC) Tower to the south along with associated safeguarding and enabling works to facilitate future expansion. The site area of T2C is approx. 130,142m^2. To align with the expected slower passenger growth in the wake of the COVID-19 pandemic it should be noted that AAHK will undertake a flexible phasing plan for the commissioning of some portions of the 3RS passenger facilities from 2024 onwards, and therefore not all elements of the T2C initial phase will necessarily be opened at the same time.

Background and Architectural Design Objectives for T2C Building Structures/Facilities

Architecturally, the T2C will be themed as a microcosm of Hong Kong, with internal finishes and interior design elements reflecting the idea of distinct civic, urban, and natural spaces - providing an underlying framework to give the concourse unique visual characteristics (design quality criteria #1, #2, #4) while taking functionality, performance, longevity, efficiency and 24/7 operations into account.

Distinct from the existing HKIA T1 where passengers move through all processes under a single roof, future T2C passengers will be required to ride an Automated People Mover (APM) from the new T2 processing facility to the new airside T2C. The two buildings will form part of a singular sequential harmonious experience for passengers. This synergy will be enhanced by the building's architecture, with the major elements and spaces of the building (such as roof form, roof columns, lighting, interior design, etc.) following a similar architectural design language. A linear ribbon roof design approach is proposed for both the T2 Expansion and T2C, with the legibility, orientation, responsiveness and clarity from the T2 Expansion extending through to the T2C. The roof is interspersed with linear skylights in the Concourse wings, and a central skylight over the central 'Node' area. Solar panels are situated at the East roof expanse and two light wells allow daylight into level 8 of the T2C. The conceptual architectural design of T2C is provided in the "Overall T2C View" drawings in ***Figure 3.4.***

This synergy and linkage will also be a feature of the interior and lighting designs for the two buildings. Lighting spectrums and portals for enhancing spatial orientation, sense of space and ambience will be designed to enhance and support the T2C architecture as well as being themed to reflect Hong Kong local experiences. Interior public area lighting is directional and designed to avoid glare from internal or external areas. Lighting to the external landscaped courtyard will be low level with some accent lighting to landscaped features and planting. Building perimeter lighting is generally provided by high mast fittings necessary for aircraft operational areas (OM5) (***Figure 3.4***).

The visual massing of the T2C is reduced by the extensive use of glass in both the main elevations and also in the Fixed Link Bridges. The roof incorporates gentle and

sweeping curvature and has a continuous roof edge profile that accentuates its linear form and flowing geometry (OM3)(***Figure 3.1***, ***Figure 3.1.2*** and ***Figure 3.4***).

Facade and roof materials and colours are in harmony with the other airport passenger buildings. Darker colours are used at the apron level to visually lift the building facades and to provide a consistent ground level banding. Silver and grey tones provide a level of reflectance to the roof edges and facade elements (OM4) (***Figure 3.1***, ***Figure 3.1.2*** and ***Figure 3.4***).

The new Air Traffic Control Tower is sited adjacent to the T2C and is connected via a glazed pedestrian bridge. The tower sits on an accommodation block which is designed to complement the Fixed Link Bridges and Concourse facades. The tower is clad in silver perforated aluminium which subtlety changes in geometry to transition from a square plan form at the base to a circular plan form at high level. Circular accommodation floors and a dedicated antenna floor provide a strong visual identity complimented by careful external lighting features which highlight the circular floors. Vertical light strips in the tower cladding funnel emphasize the verticality of this element of the 103m high structure. The new tower will provide an iconic architectural element for HKIA.

Landscape Design for the T2C

In line with the architectural design concept and theming, and inspired by Hong Kong as one of the world's most exciting and vibrant cities, the planned landscape design of the T2C will provide a critical, integrated solution to ensure the desired character and theming is achieved (design quality criteria #1, #2, #5). ***Figure 3.4*** illustrates some of the T2C design elements.

Landscape designs are a key consideration for the interior of the concourse, mainly in the external courtyard area at the Departures Level (design quality criteria #5). The character of the T2C interior landscape will be a continuation of the T2 Expansion interior landscape narrative with the T2C landscape focus being the courtyard.

T2C will incorporate a substantial landscaped outside courtyard which is accessed directly from the departures level. Passengers are able to enter the courtyard from a number of locations. The courtyard has a variety of pathways, seating areas and landscaping features, along with trees and low level planting. Greening will comprise shrubs and plants from the HKIA APSL. The courtyard has been designed to be a relaxed and natural environment for passenger enjoyment with landscaping visible through the glass facades from the surrounding interior concourse seating and circulation areas (OM6)(***Figure 3.1.2*** and ***Figure 3.4***). The courtyard will be a major and unique feature and the landscape will help provide a range of experiences and activities that can be enjoyed from within the courtyard itself as well as from inside the concourse areas. The concept relies on creating a series of hills or mounds that elevate the planting and help define intervening spaces, providing a series of different spaces and routes through the landscaped areas. The courtyard may be seen as a garden within which one can casually walk and explore different vistas and attractions. The main facilities in the courtyard will include water features, a variety of planting

themes, elevated walkways, children's play areas and open spaces that collectively will allow for a range of outdoor events and activities to take place. T2C is also targeting the Platinum rating in the BEAM Plus Assessment. Again, given the special nature of the T2C as an airport building located entirely in the airside operational area of the airport, it is recognised that no external perimeter landscaping and greenery is possible. Therefore, planting and soft landscaping will be limited to internal areas of the building, including in an outdoor courtyard within the confines of the concourse, as detailed above. The courtyard landscape will be classed as an internal landscape and will not count towards the overall project greenery coverage.

3.3 ANCILLARY BUILDINGS

Ancillary buildings are mostly located within the Eastern and Western Support Areas with some also located around the T2C (refer to ***Figure 3.1***). These buildings are of a functional nature and include ground services equipment, staging and servicing facilities, air traffic control observation facilities, Civil Aviation Department (CAD) facilities, Hong Kong Observatory (HKO) facilities, stores, security gatehouses, and many other small ancillary buildings. These buildings support the airport operating function and the aviation system at the airport and are a critical part of the 3RS Project. Given the highly constrained airside environment with its focus on safety aspects, the design of all ancillary buildings is very functional, with limited, if any landscaping. However, a holistic design of such buildings has been considered with buildings designed to be in harmony with the other main airport buildings, i.e. T2 and T2C. ***Figures 3.5.1*** to ***3.5.7*** provide indicative images of the general appearance of some key ancillary buildings while ***Figure 3.5.8*** provides typical ancillary building designs with mitigation measures.

4 TREE TREATMENT AND MASSED PLANTING PROPOSALS

This chapter details the treatment of trees for the Project, summarizing locations, size, number and plant species of trees to be transplanted, felled or compensated, before providing information on the programme implementation, maintenance and management schedules.

4.1 TREE TREATMENT

The principle of tree preservation/ tree treatment follows the below hierarchy, with #1 being the top priority:

1. Retain trees at their existing locations and avoid impacting trees if possible;

2. If impact and removal of trees is unavoidable (e.g. due to overlap with construction works or impact on long-term viability of the tree), suitable trees should be transplanted off-site in a permanent location. The preferred location of the receptor site is near to the project site if possible, to retain the amenity effect in the vicinity. Only trees suitable for transplanting should be considered for transplanting. Factors to be taken into account when determining if a tree is transplantable include:

    - Conditions of the tree to be transplanted (including form, health and structure), which may affect the success of the proposed transplanting;

    - Size (transplanting is often deemed impractical for trees over a certain size), species (species are recognised as generally having a different survival rate after transplanting), and conservation status of the tree to be transplanted;

    - Availability and suitability of a permanent receptor site, both within and outside the Project site;

    - Adequate time for preparation of any transplanting operation;

    - Identification of a long-term maintenance party for the transplanted tree(s);

    - Access to the existing location and transportation to the receptor site (including availability of access to accommodate the tree, topography of the proposed route, engineering limitations, etc.); and

    - Cost-effectiveness.

3. If neither retaining nor transplanting trees is considered practicable, the last choice is to fell/ remove trees impacted by the Project and undertake compensatory tree planting either within the site or at an appropriate off-site area.

The proposed tree treatment were updated in this Final L&V Plan. The difference between the Initial Revised L&V Plan and this Final L&V Plan is shown in ***Annex C*** – Tree

Assessment Schedule. Approximately 2,414 trees were included in this LVP within the area covering 3RS key project components. A summary of tree treatment is provided in ***Table 4.1***.

Annex C shows the tree assessment for each tree individually in schedule format. ***Annex E*** shows the tree treatment on each individual tree. ***Annex G*** shows the recipient locations for transplanted trees while ***Annex H*** shows photo records of "retain" and "transplant" trees. The summary of the tree treatments are described below.

Table 4.1 Summary of Tree Treatment (1)

Trees felled or to be felled	Trees transplanted	Trees retained or to be retained	Total Trees
2,342	**23**	**49**	**2,414**

Note (1): Tree numbers are based on November 2022 tree records.

As mentioned in the Initial Revised L&V Plan, tree treatment numbers were subject to adjustment due to changes in baseline data (e.g. from typhoons, etc.) and as more detailed design for Project buildings and infrastructure became available. For this Final L&V Plan, the tree treatment numbers are updated with revised information shown in ***Table 4.1.***

The details of the individual trees are marked in the tree assessment schedule in ***Annex C***.

Further details of tree treatment are provided below.

Trees to be Retained

49 trees were assessed as not being affected by the 3RS works and are being retained. Measures were implemented to protect the existing retained trees on site, including but not limited to the following:

1. The Contractor shall ensure, for the duration of the works that:

    - No unnecessary intrusion into existing trees to be retained / areas of woodland or shrubland is made;

    - All access routes to construction areas which need to pass through areas of existing trees to be retained / woodland or shrubland shall be approved by the Engineer;

    - The limits of site clearance are to be agreed by the Engineer on site before site clearance commences. All trees to be cleared shall be marked by the Contractor and approved by the Engineer before felling;

    - No nails or other fixings shall be driven into trees;

    - No fencing or signs shall be attached to trees;

- No materials or machinery shall be stored within the area of a tree's crown diameter;

- No workshop, canteens, or similar shall be installed beneath trees, nor shall equipment maintenance etc. be carried out under trees; and

- No trees shall be used as anchors for ropes or chains used in guying, pulling and the like.

2. The Contractor shall exercise the greatest care during the progress of the work to avoid damage to any tree which is not required to be cleared.

   - As soon as the site or any part thereof becomes available the Contractor shall erect Temporary Protective Fencing around each such tree or group of trees, preferably to protect the whole area within the spread of the tree's crown, but no closer than 2m from the trunk of any such tree. A generic tree protection plan is provided in ***Annex D*** for reference. In case there is site limitation to provide the standard tree protection zone, the contractor should develop a contract-specific tree protection plan comprising of the detail proposal of tree protection zone and fencing. The plan should be agreed with the Engineer.

   - The Contractor shall inform the Engineer if works are to be carried out within such fenced areas and, save with the express permission of the Engineer or on his order, all such work shall be executed using only hand-held tools.

3. The Contractor shall maintain the Temporary Protective Fencing in good repair and subsequently remove it.

   - Removal shall be subject to the permission of the Engineer which shall not normally be given earlier than the substantial completion of an adjacent part of the Works other than Landscape Soft works.

   - The Contractor may seek permission to remove the fencing temporarily if its removal is necessary for the satisfactory execution of the Works. The Contractor shall reinstate the temporary protective fencing as soon as possible.

4. Temporary Protective Fencing shall be provided, and shall ideally be constructed of strong, impenetrable material such as steel sheet or wooden board.

   - In certain circumstances where space for tree protection is a particular problem, protection of the tree trunk with planks may be acceptable. In these cases, the ground within the root zone should be protected from compaction with mats and gravel or boards/tracks for vehicles. (It should be noted that these treatments should only be used temporarily so that anaerobic soil conditions do not build up in the root zone).

5. Unless adequate proof is submitted by the Contractor to demonstrate that death or damage of existing vegetation was caused by circumstances beyond his control,

replacement of dead or damaged plants of similar sizes of the same species is required as instructed by the Engineer.

- When instructed by the Engineer, slow release fertilizer shall be applied to existing mature trees in a feeding band 1.5m either side of the branch spread as and when required.

Trees for Transplantation

36 trees affected by the 3RS works were proposed to be transplanted in August 2020 as mentioned in the initial L&V Plan. There were 26 trees transplanted, however one of them was removed after transplantation due to damage by typhoon and 2 trees were removed after transplantation due to the construction of a temporary emergency hospital for the COVID-19 pandemic. In addition, 10 trees were adversely affected and could not be transplanted due to their low survival rate as determined by the tree specialist. Therefore, the total number of trees eventually transplanted was 23.

Selection for transplanting has taken account of the above criteria and only trees with high conservation value or medium to high amenity value (including rare and precious species and with high suitability for transplanting) have been considered. Most of the 3RS Project surveyed trees found to be in conflict with the proposed works had low amenity value, poor structure/form for transplanting, low anticipated survival chance after transplanting, were too mature or oversized or had poor health, hence were not found to be suitable for transplanting. The locations of the trees identified as suitable to be transplanted are shown in drawing no. ***TRD/3103/AA-XX-G/DR/000001*** and ***TRD/3103/AA-XX-G/DR/100001-100010*** of ***Annex E***. The recipient locations of transplanted trees to date and the tentative identified recipient locations for the remaining trees to be transplanted are shown in ***Annex G***. A typical tree transplantation specification is also provided in ***Annex F*** for reference. The species to be transplanted range in size from 4-14 m in height and further details can be found in ***Annex C***. Tree transplanting is undertaken before or during the early stages of construction at respective areas.

Trees for Removal/ Felling

2,342 trees were assessed as needing to be removed/ felled. In accordance with the hierarchy of tree treatment presented above, trees in conflict with the proposed works, with low conservation or low amenity value (i.e. common species and/or of poor health/ structure/ form) and with low suitability for transplanting were recommended to be felled (shown in Drawing no. ***TRD/3103/AA-XX/G/DR-000001*** and ***TRD/3103/AA-XX/G/DR/100001-100010*** of ***Annex E)***. Further details of species to be felled are listed in ***Annex C*** showing the trees range in size from 2-15 m in height. Tree removal is undertaken before or during the early stages of construction at respective areas.

It should be noted that no protected/ rare/ endemic/ old and valuable tree species (including trees for transplantation and removal/ felling) were affected by 3RS works, with reference to the IUCN Red Data Books, international conventions for conservations of wildlife, as well as relevant local legislation and other references (i.e.

Cap. 96 Forests and Countryside Ordinance; Cap. 586 Protection of Endangered Species of Animals and Plants Ordinance; Register of Old and Valuable Tree; Rare and Precious Plants of Hong Kong; China Plant Red Data Book). One individual of rare tree species (*Gleditsia australis*) was recorded (Xing *et al*., 2000)[1], but this tree species is not protected under local or regional legislation. Furthermore, the location of this tree was acquired by the government for construction of a temporary emergency hospital to handle the COVID-19 pandemic. It is not located within 3RS works areas and therefore not affected by 3RS construction works.

Tree Compensation

Taking relevant technical circulars into account, e.g. *DEVB TC (W) No. 4/2020 Tree Preservation,* a compensatory tree planting ratio of 1:1 in terms of quantity is targeted for the trees that require felling to make way for the 3RS project. However, according to Appendix C of *DEVB TC (W) No. 4/2020*: "As far as practicable, implementation of compensatory tree planting should be of a ratio not less than 1:1 in terms of number, i.e. the number of compensatory trees onsite and offsite should not be lower than that of the number of trees removed including dead trees, but excluding trees of undesirable species.". As *Leucaena Leucocephala* is classed as an undesirable species, it has been excluded from the tree compensation target.

It is noted that 136 of the tree species *Leucaena leucocephala* were assessed as needing to be felled. As this undesirable species has been excluded, the target number of compensatory trees was adjusted to 2,206 from 2,342. 2,262 compensatory trees are proposed to be compensated outside the 3RS project works sites at HKIA, including scattered plots of available land on the Airport Island (refer to ***Annex G*** for plot locations) while 38 compensatory trees are proposed to be compensated at the Airport North Interchange north of the T2 Expansion (Drawing no. ***CP_8*** of ***Annex G***).

In order to enhance the planting arrangements of the compensatory trees, the combined land area of the scattered plots provisionally allocated for compensatory tree planting is around 2.5 times the size of the combined land areas from which trees are being lost due to 3RS Project works on existing airport land. This is due to the fact that most of the trees proposed to be felled were planted much more densely than the spacing requirements now laid down in prevailing guidelines. As such, the target compensatory tree numbers are based on a like-to-like approach, whereby a range of tree spacing intervals (i.e. 3 to 5 metres) are adopted depending on the tree planting densities previously observed in specific areas.

For the landscape and visual mitigation arrangements at Sha Chau, as indicated on Drawing No. MCL/P132/EIA/15-028.6 of the approved EIA report, it should be noted that EP commitments at Sha Chau focussed on minimizing the footprint of the daylighting / pipeline alignment works, with the aim of avoiding impacts to the nearby egretry. As such, no trees were permitted to be felled and transplanted (CM9) in conjunction with the Sha Chau works.

[1] Xing, F.W., Ng, S.C., and Chau, L.K.C. (2000). Gymnosperms and angiosperms of Hong Kong. *Memoirs of the Hong Kong Natural History Society* **23**: 21-136.

Given the island's undisturbed nature, its thriving egretry, the lack of any available areas for additional tree planting (OM6) and major access difficulties, compensatory tree planting (OM7) on Sha Chau was not pursued. Therefore, the considered mitigation measures (i.e. CM9, OM6 and OM7) indicated on approved EIA report for Sha Chau were not applied (refer to ***Figure 3.1.4***).

A summary of the estimated tree compensation numbers in various locations is shown in ***Table 4.2***. The tree planting quantity and planting spacing are subject to actual site constraints e.g. clashes with supporting infrastructure, underground utilities etc. The selection of tree species and planting arrangements are to be developed during the detailed designs of the compensatory planting locations.

Table 4.2 Proposed Tree Compensation Locations & Estimated Numbers

Location (Refer to Drawing no. ***CP_1*** to ***CP_8*** of ***Annex G***)	**Proposed Compensatory Trees No.**
Within 3RS works sites *(at Airport North Interchange)*	38
Outside 3RS works sites (HKIA South Cargo Area)	2,262
TOTAL	**2,300**

*Note: Estimated numbers are based on a like-for-like approach, whereby a range of tree spacing intervals (3 to 5m) are adopted depending on the tree densities previously observed in the area. The compensatory tree numbers will be subject to actual site constraints during the construction stage.

It is noted that compensatory planting opportunities are further restricted by the HKIA APSL that controls the species, density and locations of trees and shrubs with due regard for aviation safety concerns relating to bird attraction at an operating aerodrome. ***Table 4.3*** lists APSL tree species planting selections and anticipated planting spacing requirements, noting other species may also be used, subject to meeting APSL requirements.

Table 4.3 Tree Species Planting Selections

Species	**Spacing (mm)**
Bauhinia variegata	4000
Callistemon rigidus	4000
Crateva unilocularis	5000
Delonix regia	5000
Lagerstroemia speciosa	4000
Plumeria rubra	3000
Pruns subgen. Cerasus	4000
Tabebuia chrysantha	4000
Tabebuia rosea	4000
Senna surattensis	3000

4.2 IMPLEMENTATION PROGRAMME, MAINTENANCE AND MANAGEMENT SCHEDULES

The trees identified as suitable for transplanting from 3RS construction sites were moved in accordance with 3RS construction progress in relevant 3RS works areas. The

compensatory trees to be provisioned on 3RS sites will be planted towards the end of the respective works programme for different works areas. Tree compensation in other locations identified across HKIA is expected to take place as the different land areas for compensation become available and in coordination with AAHK land use planning around each area.

AAHK coordinate all required tree management elements, including the phasing and detailed planning for compensatory trees. This work includes the development of appropriate landscaping detail in the various planting locations to meet recognised requirements for tree planting.

The 3RS EM&A Manual specifies that planting works shall be checked during a 12-month establishment period after completion of 3RS construction works, in this case after each batch of transplanting or compensation works is completed. Engineering and construction works progress shall be regularly reviewed on site to identify the earliest practical opportunities for the tree compensation and landscaping works to be undertaken.

Measures undertaken during the construction phase and the 12-month establishment period shall be audited by a landscape architect, as a member of the Environmental Team (ET), on a regular basis to ensure the required standards are achieved and works are successful. Documentation on compliance will be carried out in the EM&A Reports as necessary. Implementation of landscape construction works and subsequent maintenance activity after each batch of transplanting or compensation works during the 12-month establishment period shall also be supervised by a Registered Landscape Architect or Professional Member of the Hong Kong Institute of Landscape Architects. Should non-compliance of the landscape and visual impacts occur, actions in accordance with the Event and Action Plan stated in Section 12.7 of approved EM&A Manual shall be carried out.

After the establishment period, responsibility for the long term management of planting works (including trees) will transfer to AAHK's long-term landscaping contractor. Planting works shall be monitored during the first 10 years after the completion of each batch of transplanting or compensation works. As such, in accordance with the approved EM&A Manual, Table 12.1 stated that long-term monitoring works should be reported on compliance by ET or Maintenance Agency as appropriate.

5 IMPLEMENTATION OF LANDSCAPE AND VISUAL MITIGATION MEASURES

This chapter provides the implementation schedule from the EIAO Process, which outlines the landscape and visual mitigation measures to be implemented, including the implementation agent, location, timing and status. Relevant drawings and figures showing the proposed mitigation measures relating to T2 Expansion, T2C and greenery are further provided in ***Figure 3.2*** to ***Figure 3.4***, ***Figure 3.6***, ***Figure 3.7*** and ***Figure 5.3.***

Table 5.1 below summarises details of the construction phase mitigation measures and the operation phase mitigation measures from the EIAO Process. Progress on the implementation of the operation phase measures will also be updated in regular EM&A reporting in due course.

Table 5.1 Implementation Schedule

						Des	C	O		
			shall be required to submit, for approval, a detailed working method statement for the protection of trees prior to undertaking any works adjacent to all retained trees, including trees in contractor's works areas.						**is checked by the ET during site inspections. A generic tree protection plan is included in the L&V Plan at *Annex D*.**	
Table 15.6	12.3	2.18, 3.2	**CM9** - Trees unavoidably affected by the works shall be transplanted where practical. A detailed Tree Transplanting Specification shall be provided in the Contract Specification, if applicable. Sufficient time for necessary tree root and crown preparation periods shall be allowed in the project programme.	All existing trees to be affected by the works; Upon handover and completion of works.	Contractor (3503, 3508 & 3801)	✓	✓		26 trees identified for transplantation in the overall project tree schedule and 3 trees being felled after transplantation; a typical tree transplanting specification has been included in the L&V Plan. **Recipient locations for transplanted trees are indicated in *Annex G*.**	Tree transplantation works are complete in accordance with tree transplanting specification.
Table 15.6	12.3	2.18, 3.2	**CM10** - Land formation works shall be followed with advanced hydroseeding around taxiways and runways as soon as practical.	All affected existing grass areas around runways and verges / Duration of works; Upon handover and completion of works.	Contractor (3303)	✓	✓		Advanced hydroseeding was carried out around taxiways and runways as soon as practicable in turfed locations and this has been checked by ET in regular inspections as necessary.	Land formation works are complete, and hydroseeding was subsequently carried out.
Landscape and Visual Impact - Operation Phase										
Table 15.7	12.3	2.18, 3.2	**OM1** - Sensitive landscape design of reclamation edge by incorporating different angles of gradient and the use of a range of armour rock sizes placed randomly in a riprap approach for an irregular appearance. Planting of native coastal plants shall be incorporated.	New land formation edge; Completion of Design Stage.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			The new seawall on the land formation edge incorporates both vertical and sloping seawalls with different rock armour sizes and shapes in a rip-rap arrangement. Multiple eco-enhanced seawall blocks are being installed to increase microhabitats and ecological value of the seawall. Planting of native coastal plants is not permitted in the Airside area in accordance with the HKIA APSL requirements due to aviation safety reasons.	Seawall installation works are complete, with remaining eco-seawall blocks targeted to be completed by Q1 2023. Refer to ***Figure 5.1*** for the overall view of the land formation edge.
Table 15.7	12.3	2.18, 3.2	**OM2** - All above ground structures, including, Vent Shafts, Emergency and Firemen's' Accesses etc. shall be, either fully integrated with the planned buildings, or sensitively designed in a manner that responds to the existing and planned urban context, and minimises potential adverse landscape and visual impacts.	All locations of above ground structures; Completion of Design Stage.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			The two new major passenger buildings have been designed to suit their respective sites whilst maintaining synergy of architectural approach. The new Terminal 2 development has been designed to provide an architectural response to the existing adjacent airport buildings such as Terminal 1 and the Ground Transportation Centre. There are access road systems at ground level providing entrances and exits from the covered coach station, carparks, HKIA Tower, and HKIA Commercial Building. The building external facades have a hierarchy of finish and colour. At ground level, darker tone grey provides a heavier visual base with lighter tone metallic silver cladding and louvres then applied to the upper podium floors. The Check-in Hall is enclosed by full height glazing allowing natural light into the public areas and views out in all directions. The main roof has a gently undulating geometry echoing the directionality of Terminal 1 and the	Design Completed. Refer to ***Figure 5.2*** to show the overall view of the above ground structures. For T2, T2C and ancillary buildings individual design detail, please refer to ***Figure 3.2, Figure 3.3*** to ***3.4*** and ***Figure 3.5.1*** to ***3.5.8***

EIA Ref. (Why)	EM&A Ref. (Why)	EP Condition	Environmental Protection Measures (What)	Location / Duration of Measures Timing of Completion of Measures (Where / When)	Implementation Agent (Who)	Implementation Stage (When)			Implementation Status (What)	Timeline (When)
						Des	C	O		
									baffled ceilings respond to this geometry – gently rising and falling to emphasis the scale of the space. The roof edges allow the baffles to continue externally providing a visually seamless transition from interior to exterior, whilst providing solar shading to the facades. At the West elevation the roof dramatically over sails the vehicle drop off, providing rain protection and a visually exciting experience. The roof edge profiles are coloured in a subtle bronze tone providing a unique identity and quality to the shaped aluminium geometry. The exterior roof surfaces are clad in silver colour tones. The roof is supported by slender, splayed steel columns which provide visually delicate elements within the public areas. These columns appear externally on the North and South elevations providing visual continuity. There are a number of buildings adjacent to the main T2 building. These include new multi-storey car park facilities (Car Park 2a and Car Park 2b), vent and Trolley Recirculation structures. The architectural treatment of these is consistent with and use the same design language as T2. Enclosed footbridges link T2 with adjacent buildings such as 11 SKIES and beyond to AsiaWorld-Expo. These footbridges follow a coherent design with glazed facades and bright, airy internal spaces. The T2C design responds to its fully airside location between the new North Runway and the Centre Runway and it is linked to T2 by Automated People Mover tunnel. The design aims to extend the architectural language theme used in T2, but subtly adapted for the building function and location. Again, the ground level perimeter of the T2C uses darker tone elevations. The Arrivals and Departures floors above are predominantly glazed, allowing dramatic views out across the aprons towards Terminal 1 and Lantau to the South and across the water to the North. Fixed Link Bridge structures use Full height glass and silver cladding. Continuing the architectural language of T2, T2C has a visually strong profiled roof line which reinforces the 'Y' shaped building footprint. The roof is interspersed with linear skylights in the Concourse wings, and a central skylight over the central 'Node' area. Solar panels situate at the East roof expanse and two light wells allow daylight into level 8 of the T2C. Splayed steel roof columns replicate throughout the Central Concourse, with concrete columns externally providing a strong sense of scale. The new Air Traffic Control Tower is sited adjacent to the T2C and is connected via a glazed pedestrian bridge. The tower sits on an accommodation block which is designed to complement the Fixed Link Bridges and Concourse facades. The tower is clad in silver perforated aluminium which subtlety changes in geometry to transition from a square plan form at the base to a circular plan form at high	

EIA Ref. (Why)	EM&A Ref. (Why)	EP Condition	Environmental Protection Measures (What)	Location / Duration of Measures Timing of Completion of Measures (Where / When)	Implementation Agent (Who)	Implementation Stage (When)			Implementation Status (What)	Timeline (When)
						Des	C	O		
									level. Circular accommodation floors and a dedicated antenna floor provide a strong visual identity complimented by careful external lighting features which highlight the circular floors. Vertical light strips in the tower cladding funnel emphasize the verticality of this element of the 103m high structure. A number of other ancillary buildings and facilities are provided as part of the 3RS Project such as Fire Stations, Maintenance buildings, airfield equipment buildings and the like. All these facilities follow a design language which carefully controls colour, facade material texture, window treatment, massing etc. Attention has been paid to the roofs of these facilities with striated patterning providing a coherent identity.	
Table 15.7	12.3	2.18, 3.2	**OM3** - Sensitive design of buildings and structures in terms of scale, height and bulk (visual weight).	All locations of above ground structures; Completion of Design Stage.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			The new T2 and T2C are very large facilities, scaled to suit not only the functional processes of Departures and Arrivals, but also to provide iconic architectural responses to their individual locations and surroundings. Careful selection of facade materials and hierarchy ensure that the scale and elevational treatment is appropriate for such large and prominent Airport buildings. The expansive glazed facades allow transparency and allow the roofs with substantial spans to be visually lightweight. The Approach to T2 via car and bus sweeps around the building allowing all elevation to be seen by departing passengers.	Design completed. For T2, T2C and ancillary buildings individual design detail, please refer to ***Figure 3.2*** to ***Figure 3.3***, ***Figure 3.4*** and ***Figure 3.5.1*** to ***3.5.8*** respectively**.**
Table 15.7	12.3	2.18, 3.2	**OM4** - Use appropriate building materials and colours in built structures to create cohesive visual mass.	All locations of above ground structures; Completion of Design Stage.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			The architecture uses a variety of colour, reflectivity, texture and modularization to provide an overall appearance in keeping with and complementary to the existing Terminal 1 and Ground Transportation Centre. T2 has integrated the existing Airport Authority office towers, enhancing their facilities and providing new landscaped external communal areas.	Design completed. For T2, T2C and ancillary buildings individual design detail, please refer to ***Figure 3.2*** to ***Figure 3.3***, ***Figure 3.4*** and ***Figure 3.5.1*** to ***3.5.8*** respectively**.**
Table 15.7	12.3	2.18, 3.2	**OM5** - Lighting units to be directional and minimise unnecessary light spill and glare.	All locations within the project site boundary; Completion of Design Stage.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			External lighting at T2 is restricted to low level bollard and kerb lighting at external landscaped decks and directional down lighting locally around the building perimeters. Street lighting is provided as per Highways code requirements for carriageway and footpath illumination. External lighting at T2C is provided predominantly by the Apron High Mast lighting systems which provide aircraft stand lighting as well as to the working area at the ground levels around the Concourse. External canopies use down lighting particularly where passenger enter and leave the building. Interior lighting is by ceiling downlights and controllable for dimming and by light sensing to minimize external glare and light spill.	Completion date will be targeted at the end of 2024. Refer to ***Figure 3.4*** to demonstrate the night time condition with the lighting design.
Table 15.7	12.3	2.18, 3.2	**OM6** - Greening measures, including vertical greening, green roofs, road verge planting and peripheral screen planting shall be implemented.	All locations within the project site boundary where greening measures can be implemented as far as possible; Ongoing duration.	Contractor (3302, 3501, 3503, 3508, 3601, 3602, 3603, 3801, 3802, 3804)	✓	✓		There are four external landscaped roof decks (two at the North side, two at the South side) which are visible from the Check-in Hall and the Arrivals Baggage Reclaim Hall of T2. The deck can be accessed by the public from the Check-in Hall and external seating and low level lighting is provided. Area of external decks with planting = 9161 square metres. There is also planting along the full length of the T2 departures kerb road. Planted area = 440 square metres. A substantial landscaped outside courtyard is also proposed to be located within the confines of the T2C.	Completion date will be targeted at the end of 2024. Refer to ***Figure 3.2***, ***Figure 3.3*** for greening measures around T2. Refer to ***Figure 3.6*** for green roofs at typical ancillary building (e.g. fire station). Refer to ***Figure 5.3*** for greening measures within T2C.

EIA Ref. (Why)	EM&A Ref. (Why)	EP Condition	Environmental Protection Measures (What)	Location / Duration of Measures Timing of Completion of Measures (Where / When)	Implementation Agent (Who)	Implementation Stage (When)			Implementation Status (What)	Timeline (When)
						Des	C	O		
Table 15.7	12.3	2.18, 3.2	**OM7** - Compensatory Tree Planting for all felled trees shall be provided to the satisfaction of relevant Government departments. Required numbers and locations of compensatory trees shall be determined and agreed separately with Government during the Tree Felling Application process under the relevant technical circulars.	All trees effected by the works; Upon handover and completion of works.	Contractor (to be implemented by future landscape contractors)	✓	✓	✓	The overall project tree schedule (i.e. ***Annex C*** of the Final L&V Plan) summarises the trees to be felled due to the 3RS Project. In accordance with relevant Government technical circulars, a compensatory tree planting ratio of 1:1, as far as practical, is targeted for all trees felled; compensatory trees are proposed to be planted in the South Cargo Area of the existing island and at the Airport North Interchange (north of the T2 Expansion). It is noted that some areas allocated for compensatory tree planting will only be available after end 2024. Reference will be made to the DevB TC(W) No. 6/2015 on Maintenance of Vegetation and Hard Landscape Features which defines the management and maintenance responsibilities for natural vegetation and landscape works, including both soft works and hard works, and authorities for tree preservation and felling.	Works are in progress. Refer to ***Annex G*** for compensatory tree planting plans.
Table 15.7	12.3	2.18, 3.2	**OM8** - Streetscape (e.g. paving, signage, street furniture, lighting etc.) shall be sensitively designed in a manner that responds to the existing and planned urban context, and minimises potential adverse landscape and visual impacts.	All locations of streetscape treatment works; Completion of Design Stage.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			External areas around T2 have been designed to provide links between facilities at ground level, whilst enabling vehicular traffic, bus and coach station access, public car parking access and improved access to the two office towers. Extensive soft landscaping is being provided to provide a pleasant environment and visual approach to and around the new and reconfigured buildings. The Departures drop-off kerb forms the iconic entrance to the expanded T2. The roof cantilevers out over the pavement and vehicle lanes, providing passengers with sun and rain protection as they arrive at the terminal by bus, taxi or car. The individual entrances are clearly signed using illuminated numerals and also illuminated 'Portals' through which passengers enter the building from the kerb-side. The external roof overhangs have white baffle ceilings which seamlessly transition to being internal beyond the full-height glass facade. The passenger entrances form strong architectural and wayfinding features, with the vaulted ceilings giving orientation and dramatic architectural response. The pavement area have been carefully planned to provide intuitive pathways from kerb to Portal whilst accommodating baggage trolley staging, signage and associated amenities. T2C is an exclusively airside facility without publicly accessible areas around the building perimeter. However, views across the Apron areas and taxiways are expansive, with full height glass facades on all elevations. Views to the sea to the North, and views across the Centre Runway, T1, Sky Bridge and Lantau beyond are maximized. Fixed Link Bridges have been designed to complement the main building facades and also allow views to the aircraft as passengers board and exit the aircraft. The iconic new Air Traffic Control Tower with its circular form and profiled silver cladding is visible from the departures lounges. Extensive external open landscaping is to be provided in the departures level external courtyard, providing external seating, raised walkways, water features and interactive elements. Airfield Ancillary buildings located around T2C use colour tones which correspond to the Main Building and Fixed Link Bridges giving a coherent design approach to all facilities.	Completion date will be targeted at the end of 2024. Refer to ***Figure 5.4*** perspective to demonstrate the detail design.

EIA Ref. (Why)	EM&A Ref. (Why)	EP Condition	Environmental Protection Measures (What)	Location / Duration of Measures Timing of Completion of Measures (Where / When)	Implementation Agent (Who)	Implementation Stage (When)			Implementation Status (What)	Timeline (When)
						Des	C	O		
Table 15.7	12.3	2.18, 3.2	**OM9** - All streetscape areas and hard and soft landscape areas disturbed during construction shall be reinstated to equal or better quality (due to implementation of screen planting, road verge planting etc.), to the satisfaction of the relevant Government departments.	All locations of streetscape treatment works; Upon handover and completion of works.	Contractor (to be implemented by future landscape contractors)		✓		As per contract specifications and in accordance with relevant Government requirements, reinstatement of streetscape and landscape areas that were disturbed during construction stage are being carried out progressively upon completion of works in the respective sites. Landscape design has generally been developed in line with the overall airport landscape theme. The streetscape and landscape areas will be checked by ET during regular inspections as necessary.	Completion date will be targeted at the end of 2024. Refer to ***Figure 5.4*** perspective to demonstrate the detail design.
Table 15.7	12.3	2.18, 3.2	**OM10** - Aesthetic improvement planting of viaduct structure through greening of structure to mitigate visual impact of viaduct form.	All locations of viaduct structures; Ongoing duration.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓	✓		Where practicable, soft landscaping will be implemented within vicinity of the viaduct structures to improve the aesthetics of the viaduct form. Since majority of the viaduct structures are constantly under shade, it is understood from other project experience, that climbers would not grow well. As such, the aesthetic improvement planting of viaduct structure will be provided within vicinity of the structure instead.	Completion date will be targeted at the end of 2024. Implementation of soft landscaping within vicinity of the viaduct structures will be carried out after end 2024 following construction completion. Refer to ***Figure 3.7***, viaduct perspective, to show the mitigation measure of the structures.
Table 15.7	12.3	2.18, 3.2	**OM11** - Sensitive design of footbridges, noise barriers and enclosures with greening (screen planting/ climbers/ planters) and chromatic measures.	All locations of viaduct structures; Ongoing duration.	Design Engineer (P282 / 3131 / 3133 / 3138 / 3142 / 3144)	✓			There are a number of enclosed foot bridges which will link the new T2 and adjacent car park buildings with other facilities. The most prominent is that which connects the new 11 SKIES development (FB5) and traverses several elevated carriageways. All bridges use similar architectural devices to provide generous internal height and glass facades on portal frames. External maintenance walkways follow a consistent design, providing a strong linear element and base to the glass above. Stair cores are treated with vertical bronze coloured cladding which provides contrast and fidelity. FB5 also uses a complex roof geometry of glazing to emphasize the gradually increasing height of the bridge as it approaches 11 SKIES. This provides a dramatic interior space as well as external appearance.	Completion date will be targeted at the end of 2024. Refer to ***Figure 5.5*** for the footbridge design of T2.

Environmental Resources Management

ERM

Scale 1:11000@A1
1:22000@A3

LEGEND

- Coverage of 3RS Key Project Components
- Boundary of Landscape and Visual Mitigation Arrangement Plan as shown in the Approved EIA Report (Register No. AEIAR-185/2014)
- Airside Turf (at grade)
- Compensatory Trees (at grade)
- Transplanted Trees (at grade)
- Runways
- Ancillary Buildings
- Existing Trees and Greening

CM1 - The construction area and contractor's temporary works areas should be minimised to avoid impacts on adjacent landscape.

CM2 - Reduction of construction period to practical minimum.

CM3 - Phasing of the construction stage to reduce visual impacts during the construction phase.

CM4 - Construction traffic (land and sea) including construction plants, construction vessels and barges should be kept to a practical minimum.

CM5 - Erection of decorative mesh screens or construction hoardings around works areas in visually unobtrusive colours.

CM6 - Avoidance of excessive height and bulk of site buildings and structures. minimisation of night working periods.

CM7 - Control of night-time lighting by hooding all lights and through minimisation of night working periods.

CM8 - All existing trees shall be carefully protected during construction. Detailed Tree Protection Specification shall be provided in the Contract Specification. Under this specification, the Contractor shall be required to submit, for approval, a detailed working method statement for the protection of trees prior to undertaking any works adjacent to all retained trees, including trees in contractor's works areas.

CM9 - Trees unavoidably affected by the works shall be transplanted where practical. A detailed Tree Transplanting Specification shall be provided in the Contract Specification, if applicable. Sufficient time for necessary tree root and crown preparation periods shall be allowed in the project programme.

CM10 - Land formation works shall be followed with advanced hydroseeding around taxiways and runways as soon as practical.

OM1 - Sensitive landscape design of reclamation edge by incorporating different angles of gradient and the use of a range of armour rock sizes placed randomly in a riprap approach for an irregular appearance. Planting of native coastal plants shall be incorporated.

OM2 - All above ground structures, including, Vent Shafts, Emergency and Firemen's' Accesses etc. shall be, either fully integrated with the planned buildings, or sensitively designed in a manner that responds to the existing and planned urban context, and minimises potential adverse landscape and visual impacts.

OM3 - Sensitive design of buildings and structures in terms of scale, height and bulk (visual weight).

OM4 - Use appropriate building materials and colours in built structures to create cohesive visual mass.

OM5 - Lighting units to be directional and minimise unnecessary light spill and glare.

OM6 - Greening measures, including vertical greening, green roofs, road verge planting and peripheral screen planting shall be implemented.

OM7 - Compensatory Tree Planting for all felled trees shall be provided to the satisfaction of relevant Government departments. Required numbers and locations of compensatory trees shall be determined and agreed separately with Government during the Tree Felling Application process under the relevant technical circulars.

OM8 - Streetscape (e.g. paving, signage, street furniture, lighting etc.) shall be sensitively designed in a manner that responds to the existing and planned urban context, and minimises potential adverse landscape and visual impacts.

OM9 - All streetscape areas and hard and soft landscape areas disturbed during construction shall be reinstated to equal or better quality (due to implementation of screen planting, road verge planting etc.), to the satisfaction of the relevant Government departments.

OM10 - Aesthetic improvement planting of viaduct structure through greening of structure to mitigate visual impact of viaduct form.

OM11 - Sensitive design of footbridges, noise barriers and enclosures with greening (screen planting/ climbers/ planters) and chromatic measures.

*NOTE: Given Sha Chau's undisturbed nature and its thriving egretry population, in order to avoid impacts to the nearby egretry, no trees were permitted to be felled or transplanted (CM9) during the pipeline alignment works on Sha Chau. Also, taking into consideration the major access difficulties on the island and the lack of any available areas for additional greening (OM6), compensatory tree planting (OM7) on Sha Chau was not pursued. In summary, the proposed mitigation measures on the Landscape and Visual Mitigation Arrangement Plan (i.e. CM9, OM6 and OM7) in the approved EIA report were not applied to the Sha Chau area.

ANNEX A

Hong Kong Regulatory Framework

A1. APPLICABLE HONG KONG STANDARDS

Key standards applicable to the LV Plan are listed below. As there are no guidelines particular to landscape design for airports, some other Hong Kong guidelines have been reviewed for comparison.

1.1 ORDINANCES AND REGULATIONS

- Environmental Impact Assessment Ordinance (EIAO) legislation (Cap. 499, S16);
- Technical Memorandum on Environmental Impact Assessment Process (EIAO-TM), particularly:
  - Annex 10 (Criteria for Evaluating Visual and Landscape Impact, and Impact on Sites of Cultural Heritage); and
  - Annex 18 (Guidelines for Landscape and Visual impact Assessment);
- Environmental Impact Assessment Ordinance Guidance Note 8/2010;
- Town Planning Ordinance (Cap 131);
- Forests and Countryside Ordinance (Cap. 96);
- Protection of Endangered Species of Animals and Plants Ordinance (Cap 586);

1.2 TECHNICAL CIRCULARS & PUBLICATIONS

- AFCD Nature Conservation Practice Note No.2 – Measurement of Diameter at Breast Height (DBH);
- Buildings Department, Lands Department and Planning Department Joint Practice Note No.1, Green and Innovative Buildings (2011);
- Buildings Department, Lands Department and Planning Department Joint Practice Note No.2, Second Package of Incentives to Promote Green and Innovative Buildings (2011);
- Buildings Department, Practice Note for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers ADV-23, Improvement of Visual Appearance and Landscape Treatment for Man-made Slopes and Retaining Walls (2004);
- Buildings Department, Practice Note for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers, APP-152;

- Environment, Transport and Works Bureau Technical Circular (Works) No. 11/2004, Cyber Manual for Greening;
- Environment, Transport and Works Bureau Technical Circular (Works) No. 7/2002- Tree Planting in Public Works;
- AFCD Nature Conservation Practice Note No.3 – The Use of Plant Names;
- DEVB Technical Circular (TC) (Works) (W) No. 3/2012 – Site Coverage of Greenery for Government Building Project;
- DEVB Technical Circular (TC) (Works) (W) No. 2/2012- Allocation of Spaces for Quality Greening;
- DEVB Technical Circular (TC) (Works) (W) No. 2/2013 Greening on Footbridges and Flyovers;
- DEVB Technical Circular (TC) (Works) (W) No. 6/2015- Maintenance of Vegetation and Hard Landscape Features;
- DEVB Technical Circular (TC) (Works) (W) No. 4/2020 – Tree Preservation;
- DEVB Technical Circular (TC) (Works) (W) No. 5/2020 – Registration and Preservation of Old and Valuable Trees;
- Geotechnical Engineering Office Publication No.1/2011, Technical Guidelines on Landscape Treatment for Slopes; and
- Geotechnical Engineering Office Publication No.1/2000, Technical Guidelines on Landscape Treatment and Bio-engineering for Manmade Slopes and Retaining Walls.
- Architectural Services Department, Study on Green Roof Application in Hong Kong Final Report (2007);
- Architectural Services Department, Universal Accessibility for External Areas, Open Space & Green Spaces (2007);
- Development Bureau, Handbook on Tree Management (2016);
- Development Bureau, Guidelines on Greening of Noise Barriers (2012);
- Hong Kong Planning Standards and Guidelines (HKPSG);
- Architectural Services Department, Universal Accessibility: Best Practices and Guidelines (2004); and

- Guiding Principles on Green Coverage for Public Housing Developments.

1.3 GREENING, LANDSCAPE AND TREE MANAGEMENT (GLTM) SECTION, DEVELOPMENT BUREAU

In addition the *Greening, Landscape and Tree Management (GLTM) Section, Development Bureau* lists a number of technical circulars and guidelines that are relevant to greening and planting for new developments such as the 3RS, including:

- *DEVB Technical Circular (TC) (Works) (W) No. 3/2012 Site Coverage of Greenery for Government Building Projects*
- *DEVB Technical Circular (TC) (Works) (W) No. 2/2012 Allocation of Spaces for Quality Greening on Roads*
- *DEVB Technical Circular (TC) (Works) (W) No. 2/2013 Greening on Footbridges and Flyovers*
- *DEVB TC(W) No. 4/2020 - Tree Preservation*
- *Guiding Principles on Green Coverage for Public Housing Developments*, jointly prepared by Planning Department and Housing Department (focuses on public housing developments specifically and not necessarily directly applicable to an airport area).
- *Hong Kong Planning Standards and Guidelines (HKPSG)*. *Appendix 3* of the HKPSG Standards lists a number of other references regarding greening, including:
  - Architectural Services Department, Study on Green Roof Application in Hong Kong Final Report (2007);
  - Architectural Services Department, Universal Accessibility: Best Practices and Guidelines (2004);
  - Architectural Services Department, Universal Accessibility for External Areas, Open Spaces & Green Spaces (2007);
  - Buildings Department, Lands Department and Planning Department Joint Practice Note No. 1, Green and Innovative Buildings (2011);
  - Buildings Department, Lands Department and Planning Department Joint Practice Note No. 2, Second Package of Incentives to Promote Green and Innovative Buildings (2011);
  - Geotechnical Engineering Office Publication No.1/2011, Technical Guidelines on Landscape Treatment for Slopes;

- Buildings Department, Practice Note for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers ADV-23, Improvement of Visual Appearance and Landscape Treatment for Man-made Slopes and Retaining Walls (2004);

- Development Bureau, Guidelines on Greening of Noise Barriers (2012);

- Development Bureau Technical Circular (Works) No. 4/2020, Tree Preservation;

- Environment, Transport and Works Bureau Technical Circular (Works) No. 2/2004, Maintenance of Vegetation and Hard Landscape Features; and

- Environment, Transport and Works Bureau Technical Circular (Works) No. 11/2004, Cyber Manual for Greening.

APPENDIX B FURTHER DETAILS OF INTERNATIONAL & LOCAL STANDARDS REFERENCED

1 INTERNATIONAL STANDARDS AND BEST PRACTICE – AIRPORT LANDSCAPE DESIGN

1.1 *INTRODUCTION*

The **Airport Authority Hong Kong** ("AAHK") is responsible for operation of the Hong Kong International Airport (HKIA). The HKIA Master Plan 2030 (MP2030) recommended expansion of HKIA into a three-runway system (3RS) ("the Project") as the best way forward to cope with the projected increase in air traffic demand and to secure the continual growth of HKIA operation for the benefit of the economic development of Hong Kong. This development option for HKIA received approval in principle from the Government of the Hong Kong Special Administrative Region (HKSAR) on 20 March 2012.

An Environmental Impact Assessment (EIA) Study Report for the Project was prepared in accordance with the study brief requirements (ESB-250/2012) issued by the Environmental Protection Department (EPD). The EIA Report for the Project (Register No. AEIAR-185/2014) was approved by the EPD on 7 November 2014 and the Environmental Permit (EP) (EP No. EP-489/2014) granted on 7 November 2014.

According to Environmental Permit (EP-489/2014) Condition 2.18, the Airport Authority Hong Kong (AAHK) shall 'no later than 3 months before the commencement of construction works on the formed land of the Project'…submit a…Landscape and Visual Plan (LVP)…to specify quality criteria on the overall landscape and visual environment of the Project with broad-brush targets to be achieved for greening and planting as benchmarked against international standards and best practises. The LVP, with drawings in the scale of 1:1000 or other appropriate scales showing the landscape and visual mitigation measures of the Project, shall include at least the following information:

- aesthetic architectural designs for building structures and facilities;
- locations, size, number and plant species of trees to be transplanted and their final transplanting locations;
- locations, size, number and plant species to be felled;
- locations, size, number and plant species to be provided or compensated; and
- implementation programme, maintenance and management schedules.'

The exact facilities covered by the 3RS LVP will be detailed within the full LVP itself. Broadly it will include the Third Runway Concourse (TRC) which has a number of high-impact design concepts being explored such as an open courtyard area and provision of sunken gardens and interior landscaping, all of which provide opportunities for greening and creation of interesting areas within the future expanded airport. AAHK

has committed to become the world's greenest airport(1) and is looking to set a new benchmark for establishment of a passenger friendly, green and environmentally sustainable concourse at the airport. The LVP will cover all 3RS design aspects. It will fulfil the above EP requirements as well as requirements of the mitigation measures set out in the EIA with regard to landscape and visual impact, construction impact on existing trees, the management of transplanted trees and the provision of compensatory tree planting for trees that have been removed. .

In a broad context, the landscape design of the LVP is also an important aesthetic component of the visual environment, and together with the architectural design of building structures and facilities, will convey a sense of arrival and departure from Hong Kong, one of Asia's most important global cities.

The purpose of the current Report is to address one particular element of the EP requirement within the LVP:

- Specify **quality criteria on the overall landscape and visual environment** of the Project with **broad-brush targets to be achieved for greening and planting** as benchmarked against international standards and best practices.

1.1.1 Approach

The LVP will include full details of local requirements related to the landscape and visual environment of 3RS as well as local requirements for greening and planting and will add detail on the relevant mitigation measures and commitments from the EIAO process. This report focuses on identifying and reviewing available and relevant international standards and/or best practices relating to the landscape and visual environment and greening and planting in an airport setting.

The approach has been based primarily on web-based research. A wide range of readily available information sources were identified which focused on the landscape master planning and design of airports around the world but also included other documentation such as architectural award information and general guidelines concerning airport design and landscaping; key documents reviewed are listed in *Appendix A*. The focus was then a review of select aviation facility case studies to draw out any commonalities prior to drawing conclusions. For completeness, some international standards not directly applicable to an airport or to the 3RS landscape and visual environment, greening and planting but with some general relevance have also been included in *Appendix B*.

While a comprehensive review of local standards and guidelines in Hong Kong will form part of the Statutory Framework review within the full LVP, some key information has been included in the current Report. In addition the Land Grant documents for CLK

(1) As stated on Hong Kong International Airport, Website, Sustainability Page. (Available at http://www.hongkongairport.com/eng/sustainability/environmental-management/index.html). Note 'Green' relates to sustainability more broadly and not just to landscape and vegetation greening.

Lot No.1 (existing airport) and CLK Lot No. 3 (NCD) have been reviewed for any planting or greening requirements.

It should be noted that a planting scheme at the existing airport has been established for many years with the airport island generally divided into four zones according to distances from runways and land use. There is also an approved plant species list with the acceptability of each species and management strategy evaluated based on their growth form and attractiveness to wildlife, particularly birds which need to be avoided near the runways and in airside areas. Plants in landside areas are divided into five categories according to their growth form, namely tree; small tree/shrub herbs and ground cover; climber; and palm. The potential attractiveness of fruits of the selected plant species to birds were also reviewed in 2012 and relative abundance of each species was estimated at that time.

1.2 INTERNATIONAL & LOCAL STANDARDS

There are no internationally recognised quality criteria, broad-brush targets, standards or best practices for airport landscapes. While international standards regarding airports do exist and include 'environment', these are primarily focused on noise emissions, air quality and greenhouse gas emissions and improving efficiency to reduce use of natural resources. In particular the International Civil Aviation Organization (ICAO)[1] amongst its five strategic objectives[2] includes 'Environmental Protection'. However the major environmental goals of this strategic objective are to: limit or reduce the number of people affected by significant aircraft noise; limit or reduce the impact of aviation emissions on local air quality; and limit or reduce the impact of aviation greenhouse gas emissions on the global climate. Any ICAO documents available concerning Airport Planning and Design focus on operational opportunities to improve fuel efficiency and reduce emissions and while the use of environmental management systems is encouraged, there are no specific standards concerning landscape design criteria or greening.

Key points from two internationally recognized accreditation schemes with some landscape provisions, LEED and CEEQUAL, are provided below, with further details in *Appendix B*. These are not aimed at airports however and factors specific to airports, such as safety considerations such as birds roosting in vegetation or necessity of clear lines of sight in some areas, may not make them practical to implement for 3RS.

[1] ICAO is a UN specialized agency, established by States in 1944 to manage the administration and governance of the Convention on International Civil Aviation (Chicago Convention)

[2] http://www.icao.int/environmental-protection/Pages/environment-publications.aspx

1.2.1 LEED

Features to note that are of relevance to soft landscape design and earn accreditation points in LEED, although not directly to be used at airports, include:

- Landscape does not require a permanent irrigation system beyond a maximum two-year establishment period or if the landscape water requirement is reduced by at least 50% from a calculated baseline.

- Provision of a vegetation roof, use of existing plant material or installation of plants to provide shade over paving areas on the site (eg vegetated planted) to minimize heat island effects.

- Provision of shade from trees over at least 40% of the total length of existing and planned sidewalks within or bordering the Project, within 10 years of landscape installation.

- Provision of trees at intervals of no more than 12 m separation along at least 60% of the total existing and planned block length (exempting driveways).

1.2.2 CEEQUAL

While CEEQUAL does include some features regarding soft landscape design they are not directly developed for airports or are focused on development in a less modified environment. Credits earned by such benchmarks as what percentage of vegetation (of any kind) of high or moderate quality has been retained as part of the design, or whether planting design has taken the appropriateness of species selection into account (to include factors such as climate adaptation, local provenance and soil stability), are not necessarily applicable to 3RS given the system will be on reclaimed land or already modified land and planting will need to follow the Airport's approved planting list.

1.2.3 Hong Kong Standards

The full LVP will include a comprehensive review of local standards and guidelines in Hong Kong as part of the Statutory Framework information it will present. However some key information deemed applicable to the current Report are summarized below.

Greening, Landscape and Tree Management (GLTM) Section, Development Bureau

This section of the HK SAR Government's Development Bureau lists a number of technical circulars and guidelines that are relevant to greening and planting for new developments such as the 3RS. These will be fully reviewed in the full LVP and key points include:

- Minimum site coverage of greenery is given in ***DEVB Technical Circular (TC) (Works) (W) No. 3/2012 Site Coverage of Greenery for Government Building Projects***.

While this refers to government buildings it again provides some context to the standards being applied in Hong Kong, even if not directly applicable to the 3RS. It states that all new government buildings are required to achieve the minimum standards as set out in *Table 1.1* below. Examples of how greenery can be achieved include vertical greening, greening on slopes with gradient >45 degrees, grass pavers, covered greenery areas and aquatic planting in water features/ bodies as well as roof greening, podium greening/ sky gardens, greening on slopes with gradient <45 degrees and at-grade greening.

Table 1.1 Minimum Requirements on Site Coverage of Greenery

Area of Site	**Minimum Site Coverage of Greenery**		**Remark**
	Total Greenery Areas	At-grade Greenery Areas	Greenery Areas at other locations
≥20,000m^2	30%	15%	No minimum Greenery Areas requirement at other locations
≥1,000m^2, but <20,000m^2	20%	10%	

- Allocation of space for quality greening on roads is provided in ***DEVB Technical Circular (TC) (Works) (W) No. 2/2012 Allocation of Spaces for Quality Greening on Roads***. While not developed for roads within airport systems, it provides an indication of what might be achieved for some areas of the 3RS. Space requirements of greening zones on roads are given as:

  - For road hierarchies with central reserves to be provided, the following requirements for Central Medium Greening Zone (CMGZ) and Roadside Verge Greening Zone (RVGZ):

    - For trunk road and primary distributors, 2.5m minimum width shall be reserved for CMGZ

    - For roads other than trunk road and primary distributors, 2m minimum width shall be reserved for CMGZ

    - 2m minimum width shall be reserved for CMGZ.

  - For roads other than those above, 1.5m minimum shall be reserved for RVGZ.

  - The CMG and RVGZ act as planting strips for at-grade planting. The guideline goes on to provide the ideal characteristics of the planting strips.

- Some general principles for greening on footbridges and flyovers provided in ***DEVB Technical Circular (TC) (Works) (W) No. 2/2013 Greening on Footbridges and Flyovers***, which states that a balanced approach should be taken in the planning and design process taking into account factors including: Sustainability; Aesthetic effect; Compatibility with environment; Cost-effectiveness in terms of whole life-cycle costs; and Maintenance considerations.

- ***DEVB TC(W) No. 4/2020 - Tree Preservation*** set out policy for tree preservation including the procedures for control of tree felling, transplanting and pruning in Government projects and departmental responsibilities in handling proposals on tree preservation and removal. It set out the basic principles that compensation should be realistic, practicable and suitable and selection of tree species for compensatory planting should take into account resource requirement, suitability and cost-effectiveness in subsequent maintenance. It states that '**as far as possible, implementation of compensatory planting should be of a ratio not less than 1:1 in terms of number**' (with some possible exceptions such as on slopes), and in principle size of compensatory trees should be appropriate to the location and function. If this 1:1 ratio can be met in terms of number, additional planting to achieve **1:1 ration in terms of aggregated DBH should be undertaken as far as practicable.** This policy also states that 'quality aspect of greenery on site such as introduced themed planting, enhancing the ecological and conservation value, increasing overall site coverage of greenery, maximizing greening opportunity through vertical greening and roof greening, etc.' should be considered.

Hong Kong Planning Standards and Guidelines

The *Hong Kong Planning Standards and Guidelines (HKPSG)* is a Government manual of criteria for determining the scale, location and site requirements of various land uses and facilities. This manual is applied in planning studies, preparation/revision of town plans and development control. In particular Chapter 4 regarding 'Recreation, Open Space & Greening' is partially relevant to the current study. It has provisions for standards of open space but these are defined per 100,000 persons for district and local open space and therefore not directly applicable to the 3RS. It does note however that generally for site development, for tree planting a 3 m wide planting strip and a minimum 1.2m soil depth (excluding drains) should be reserved and for other plantings, a minimum 1 m wide planting strip is recommended. This guideline does also provide some criteria for greening, however these are for residential developments and quantified around numbers of people, so again are not applicable.

Guiding Principles on Green Coverage for Public Housing Developments

Guiding Principles on Green Coverage for Public Housing Developments has been jointly prepared by Planning Department and Housing Department and it focuses on public housing developments specifically and so is not necessarily applicable to an airport area. This guideline recommends an **overall target of 30% green coverage** for public housing developments but subject to individual site characteristics and constraints, **a lower percentage of green coverage could be considered on a case by case basis** while **20% should be considered as a minimum** unless constrained by special circumstances. There are **incentives** laid out in this guideline **to encourage greening** (eg communal sky gardens on residential buildings with greenery may enjoy exemption from Gross Floor Area (GFA) and/or Site Coverage (SC) calculations under the Buildings Ordinance (BO), Buildings Department (BD), Lands Department and Planning Department Joint Practice Note No. 1, Green and Innovative Buildings (JPN No. 1)). While the percentage green coverage targets and incentives set out in this guideline are not

necessarily applicable to 3RS, they are specific to Hong Kong and might be used as an initial reference to develop more specific airport greening targets.

For industrial and commercial developments, a minimum standard of 0.5m^2 local open space per worker for landscaping and passive recreation use is required. While this may not be directly applicable to 3RS, the system will need to consider its workforce, and for any open space requirement, a percentage should be available for greening and planting purposes.

In addition, *Appendix 3* of the HKPSG Standards lists a number of other references regarding greening, including:

- Architectural Services Department, Study on Green Roof Application in Hong Kong Final Report (2007);
- Architectural Services Department, Universal Accessibility: Best Practices and Guidelines (2004);
- Architectural Services Department, Universal Accessibility for External Areas, Open Spaces & Green Spaces (2007);
- Buildings Department, Lands Department and Planning Department Joint Practice Note No. 1, Green and Innovative Buildings (2011);
- Buildings Department, Lands Department and Planning Department Joint Practice Note No. 2, Second Package of Incentives to Promote Green and Innovative Buildings (2011);
- Geotechnical Engineering Office Publication No.1/2011, Technical Guidelines on Landscape Treatment for Slopes;
- Buildings Department, Practice Note for Authorized Persons, Registered Structural Engineers and Registered Geotechnical Engineers ADV-23, Improvement of Visual Appearance and Landscape Treatment for Man-made Slopes and Retaining Walls (2004);
- Development Bureau, Guidelines on Greening of Noise Barriers (2012);
- Development Bureau Technical Circular (Works) No. 4/2020, Tree Preservation;
- Environment, Transport and Works Bureau Technical Circular (Works) No. 2/2004, Maintenance of Vegetation and Hard Landscape Features; and
- Environment, Transport and Works Bureau Technical Circular (Works) No. 11/2004, Cyber Manual for Greening.

BEAM Plus

BEAM Plus is an accreditation scheme which has been set up by the Hong Kong Green Building Council Limited (HKGBC) which strives to promote the standards and development of sustainable buildings in Hong Kong and develop practical solutions for Hong Kong's unique, subtropical built environment of high-rise, high density urban area. HKGBC has developed various Building Environmental Assessment Methods (BEAM) to undertake assessments which cover the planning, design, construction and commissioning of a new building projects and as such could be applicable to 3RS.

Overall BEAM seeks to reduce the environmental impacts of a new building while also improving environmental quality and user satisfaction. There are no overarching assessment aspects for landscape or greening; however assessment criteria relevant to landscape and greening are included within Site Aspect categories of BEAM Plus Neighbourhoods and New Buildings. BEAM Plus concerning new buildings includes criteria for providing appropriate planting on site equivalent to at least 30%-50% of the site area in residential premises and Neighbourhoods has credits points if over 5% of the site area is green space, open space or blue assets. Since 3RS is not residential these are not directly applicable but BEAM does allow for refinement of criteria according to specific conditions and these criteria may be adapted to suite an aviation facility with other higher priorities such as and safety and functionality. To maximize the provision of greenery, however, internal landscapes could be provided where possible, to improve the indoor environmental quality and visual benefit of occupants within 3RS.

CEEQUAL

CEEQUAL is an international evidence-based sustainability assessment scheme for civil engineering and infrastructure projects that was first developed by the UK Institution of Civil Engineers in year 2003. CEEQUAL aims to assist clients, designers and contractors in the delivery of improved sustainability performance and strategy during the course of a project, covering the planning, design and construction phases.

The AA is pursuing a Whole Team Award for the Third Runway and Associated Works contract of the 3RS Project. The CEEQUAL assessment covers wide-ranging aspects of sustainability performance, including some landscape and visual issues. The AA has currently already completed the Interim Client and Design Award related sustainability assessment under CEEQUAL and has achieved an Excellent rating for the Interim Award.

1.2.4 Land Grant Requirements

Within the Land Grant documents for the Airport, there are specific provisions for Landscaping requiring development of a Landscape Master Plan or Conceptual Landscaping Submission.

For CLK Lot No. 3 (NCD) the Landscape Master Plan must show compliance with the following conditions which are relevant to this Report:

- **Not less than 30% of the area of the lot**, in which, as far as this Special Condition is concerned, shall exclude the site or sites for the provision of the Airport Operational Development, **shall be planted with trees, shrubs, or other plant**s and **not less than 50% of the said 30%** (hereinafter referred to as **"the Greenery Area"** shall be provided at such location or level as may be determined by the Director at his sole discretion, so that **the Greenery Area shall be visible to pedestrians or accessible by any person or persons entering the lot**. The decision of the Director on which landscaping works proposed by the Grantee constitutes the said 30% shall be final and binding on the Grantee. The Director at his sole discretion may accept other non-planting features proposed by the Grantee as an alternative to planting trees, shrubs or other plants.

- All landscaping within the lot shall comply with the latest version of the Approved Plant Species List as published by the Airport Authority.

- No tree growing on the lot or adjacent thereto shall be removed or interfered with without the prior written consent of the Director who may, in granting consent, impose such conditions as to transplanting, compensatory landscaping or replanting as he may deem appropriate.

For CLK Lot No.1 (existing airport) no specific conditions are provided but the following clauses relate to landscaping:

- The Grantee shall within three months from the date of the Agreement, submit a Conceptual Landscaping Submission indicating landscape treatment for the Lot, including the preservation and enhancement of the natural landscape reserve. The Conceptual Landscaping Submission will give such details of all planting and hard finishes of all landscape areas, slopes and retaining structures as the Director may require.

- Prior to commencement of any building works (other than site formation works) for each part or parts of the Lot, the Grantee shall submit Detailed Landscaping Submission which shall include schedules and drawings and such other information as the Director may require, giving details of the hard and soft landscaping layouts and works in accordance with the approved Conceptual Landscape Submission.

1.3 SELECT CASE STUDIES - INTERNATIONAL AIRPORTS' LANDSCAPE MASTER PLANNING

As confirmed in *Section 1.2* there are no relevant international quality criteria, broad-brush targets or standards for airport landscapes. A number of documents concerning airports' landscape master planning where therefore reviewed from around the globe, from publically available information. A full list of these documents is provided in *Appendix A* including summary information for each.

The reference sources were evaluated to identify standards and best practices applied to each airport landscape design. Overall many of the same themes kept emerging from the document review and several case studies were then selected for further elaboration, based on the following criteria:

- Developed within the last 10 years, which is a period considered most likely to include advancements in modern landscape design for airports;
- Included specific references to landscape standards, guidelines, principles and design criteria;
- Provided a good illustration of particular themes relevant to the Study; and
- In combination, present a cross section of different countries and climates/ situations.

The selected case studies are listed below and the key information for each one provided in *Sections 1.3.1 to 1.3.6*.

1. "Airport Landscape – Urban Ecologies in the Aerial Age", edited by Sonja Duempelmann and Charles Waldheim, published by the Harvard Graduate School of Design, 2014;
2. Terminal 3 Interior Landscape, Changi Airport. For the Civil Aviation Authority of Singapore (CAAS) **(Singapore)**;
3. "Brisbane Airport 2009 Landscape Masterplan (Revised 2010)", Brisbane Airport Corporation Pty Ltd, August 2010 **(Australia)**;
4. "Edmonton International Airport Landscape Design Guidelines", Edmonton Airport Airport, October 2010 **(Canada)**;
5. "Airport Landscape: Schipol", Adriaan Geuze & Maarten Buijs, Scenario Journal, May 2014 (**Netherlands**); and
6. Sustainable Airport Planning, Design and Construction Guidelines for Implementation on All Airport Project, Los Angeles World Airports, 2010 (**USA**) with case study of "Los Angeles International Airport Northside Plan: Design Guidelines and Standards", Rios Clementi Hale Studios, May 2014

1.3.1 Airport Landscape – Urban Ecologies in the Aerial Age

This document reviews the landscape design development of 26 airports of varying sizes located in North America, Europe, Asia-Pacific and North Africa. The evaluation identified a number of landscape themes:

- The use of landscape to mitigate air, soil and water pollution, manage stormwater runoff and risk to operations from wildlife and to enhance the airports appearance; and

- The conversion of airports into sites for urban agriculture, renewable energy and urban development to enhance environmental quality.

1.3.2 Terminal 3 Interior Landscape, Changi Airport, Singapore [(1)]

This document focuses on the design of the interior landscape for Singapore's Changi Airport. The landscape design criteria were to:

- use landscape elements to enhance and to become a dominant feature of the architecture, enhancing the city state's aim of being a 'city in a garden';

- develop a unique landscape design palette appropriate to the scale and use of the building;

- establish an interior environment where planting is part of the architecture, not just as accents and decoration.

- devise a low-cost, light-weight system for growing massed climbing plants.

Terminal 3 now contains a huge vertical garden, over 300 m wide and reaching five storeys high, with more than 10,000 plants and 25 species of climbers. It also has a an automatically controlled louvre system and unique roof with over 900 skylights with specific double-glazed low-emissivity low iron glass, which all work to help control temperature and reduce glare while still allowing penetration of natural spectrum of daylight into the building.

1.3.3 Brisbane Airport Landscape Masterplan, Brisbane, Australia [(2)]

This landscape masterplan for Brisbane International Airport was guided by three planning principles:

- Planning Principle 1: **Landscape Sustainability** - use sustainable landscape and open space planning and design with four main considerations:
  - Drought tolerance
  - Non-bird and flying fox/bat attracting
  - Subtropical design
  - Cost-effective maintenance.

  ie This included planting species which are drought tolerant, didn't attract birds and bats, are characteristic of the local micro-climate and cost-effective to maintain.

(1) https://www.asla.org/2009awards/043.html

(2) http://www.bne.com.au/sites/all/files/content/files/2009 Landscape Master Plan as at 3 August 2010.doc__0.pdf

- Planning Principle 2: **Landscape Values** - minimise adverse environmental impacts, balance the airport's built-form and complement biodiversity values with four main considerations:
  - encouraging connectivity between biodiversity and landscape;
  - enhancing scenic amenity;
  - minimising water use; and
  - separating urban areas.

  In separating urban areas, one strategy was to provide scenic landscape buffers that contributed to scenic amenity and outdoor recreation opportunities e.g where high traffic areas overlook low scenic preference areas such as car parks. It also recognises the potential to include landform modification eg mounding, for the buffer areas.

- Planning Principle 3: **Open Space Network** – facilitate public access through an attractive and innovative landscape setting for the enjoyment of the community consisting of:
  - Landscape character;
  - Cultural connection;
  - Outdoor recreation and connectivity;
  - Sport and recreation; and
  - Community focus and tourism.

The master plan did not refer to global best practice or guidelines but complied with several local and provincial-level government policies (e.g Queensland Tourism Strategy: A 10-year vision; South East Queensland (SEQ) Regional Plan; SEQ Active Trails Strategy; Water Sensitive Urban Design: Technical Guidelines for DEQ; SEQ Outdoor Recreation Strategy; Brisbane Airport Corporation (BAC)'s 2009 Master Plan; BAC's Airport Environment Strategy; BAC's Biodiversity Management Strategy and BAC's Drainage Master Plan).

Within this Landscape Master Plan a provision that landscape treatment must be consistent with the 'Landscape Area hierarchy and landscaping requirements' is made. Landscape areas are defined as including 'entrances, pedestrian areas and soft-scape within car parks'. In talking of landscape areas and plant selection this document stipulates minimum criteria for landscape treatment as:

- High Public Exposure Areas: 15% of Site

- Medium Public Exposure Areas: 10% of Site

- Low Public Exposure Areas: 5% of Site

1.3.4 Edmonton International Airport Landscape Design Guidelines, Edmonton, Canada[1]

The landscape design guidelines were guided by the following principles:

- create a '**sense of place**' by relating landscape design to the unique character of the city;
- '**greening**' of the airport by use of vegetation throughout the site with a definitive vegetated edge;
- **sustainable and maintainable** – use of low impact development techniques throughout development to mitigate environmental impacts;
- create a **welcoming gateway** to the airport to make an impression on visitors as they travel from the highway to the terminal;
- create **complimentary gateway**s within the airport lands and on its edge;
- develop a **healthy community** by providing opportunity for **passive outdoor recreation**;
- **reuse existing on-site materials** including boulders and fill excavated from the apron; and
- ensuring measures are **economically feasible**.

1.3.5 Landscape Strategy, Schipol Airport, Amsterdam, Netherlands [2]

The landscape strategy for Schipol had four "layers":

1. **Runway Verges**: For those arriving at Schiphol, Holland's green and tidy image should be confirmed by well-maintained green grassed verges at all times;
2. **Green Route**: Various airport services, facilities and centres are positioned along a loop road and should be linked by a uniform landscape treatment which characterizes these auxiliary areas;
3. **Infill Planting**: In amongst the airport buildings, facilities and services are many areas of open space and vacant land and all areas without an identifiable purpose, are planted with trees; and
4. **Visual Access**: The most impressive visual quality of an airport is the landing and take-off of planes and therefore visual corridors are kept open for people to enjoy this feature.

(1) http://corporate.flyeia.com/sites/default/files/Construction/eia_landscape_guidelines_oct_2010_v8.pdf

(2) http://scenariojournal.com/article/airport-landscape/

A key aspect of the strategy was the need for large areas of tree planting which meant that the species had to be carefully selected. They needed to be cost effective, easily-maintained, easily-propagated and not attract birds. Birch trees were selected and with the added advantage that their fibrous roots do not interfere with subterranean infrastructure.

1.3.6 *Sustainable Airport Planning, Design and Construction Guidelines for Implementation on All Airport Project*[1] with Case Study of *LAX Northside Plan, Los Angeles International Airport, USA*[2]

The overarching *Sustainable Airport Planning, Design and Construction Guidelines for Implementation on All Airport Projects* is a document for all Los Angeles International Airport. It lists just three performance measures for 'Landscape Design':

1. Reduce or eliminate potable water use for landscaping - Design landscaping to use 70% less potable water than allowed by local regulations once established OR 50% less than an average local baseline for similar facilities once established (temporary increased irrigation allowed for one-year maximum to establish new plantings calculated from a mid-summer baseline);

2. Reduce impact of fertilizer use

3. Provide Infrastructure for composting & Vermiculture.

In addition there are measures related to 'Heat Island Reduction – Roof' which target installation of '**a vegetation green-roof for greater than 50% of the total roof area**' and for 'Heat Island Reduction – Non-roof' targeting to '**install trees to provide shade within 5 years for at least 30% of dark colored impervious surfaces**' using native or climate-tolerant trees and large shrubs, vegetated trellises or other exterior structures supporting vegetation. It also states to 'substitute vegetated surfaces for impervious surfaces' and conversely to 'landscape to reduce heat through plant transpiration'.

The landscape design guidelines for LAX Northside case study specifically support the overall development concepts of the designated three districts: the LAX Northside Centre District, the LAX Northside Campus District and the LAX Northside Airport Support District. In addition, a key design principle was to prevent future interactions between birdlife and the working airfield. The landscape guidelines and standards have been organized around seven zones that exist within these three districts. These areas have been selected to help focus specific plants from the overall planting palette into appropriate locations. The seven zones designed were:

1. **Landscape setbacks** - used primarily to screen development from neighbouring communities and differentiate boundaries along property lines. These areas, depending on their location within the LAX Northside, consist of drought tolerant,

(1) https://www.lawa.org/uploadedFiles/LAXDev/News_for_LAXDev/Sustainable/Airport%20PDC/Guidelines/Jan08.pdf
(2) http://lawa.org/GDZ/pdf/LAXN%20Design%20Guidelines.pdf

low maintenance and durable materials that provide options for trees, shrubs and groundcover. The planting palette combined 50% non-native and 50% native plant material;

2. **Streetscapes** - primarily evergreen and non-native, allowing a consistent visual appeal year-round, in addition to being drought tolerant and non-invasive. The planting palette combined 70% non-native and 30% native plant material;

3. **Airport support zones** will have minimal planting owing to their proximity to the airfield. Most plant material was groundcover and shrubs and limited numbers of trees. This zone combined 80% native and 20%non-native plant material;

4. **Landscape buffer zones** consist of 100% percent locally-native, drought tolerant plant materials requiring limited to no maintenance;

5. **Recreation zones** are open space areas that required specific and particular groundcover for active playing fields, and intensive uses, such as dog parks and running paths. The planting palette for this area type was drought tolerant, non-invasive and will require frequent maintenance owing to heavy usage. The palette stipulated locally native species combining 80% native and 20% non-native plant material;

6. **Parking and development zones** were the largest landscaped areas within the LAX Northside area and are the surface parking areas required for each development. The planting palette for these areas consists of a hybrid mix of 40% non-native and 60% native plants. The trees, shrubs and groundcover options were compatible with storm water management systems, such as bioswales or permeable paving systems; and

7. **The urban tree line zone** is one of the most distinguished design features at LAX Northside. A line of trees runs the entire length of the LAX Northside and provides an edge through which development frontages engages and interacts. This row of trees is intended to be planted with a single tree species that is an evergreen species known for its low maintenance, capability for slender but tall growth in a conical form, and vibrant light green needles. This defining line creates an identity for the LAX Northside, while buffering visual and audible impacts from future developments on adjacent communities.

1.4 REVIEW OF CASE STUDIES

The case studies and documents reviewed went some way to illustrating the unique situation of each airport facility in terms of landscaping. Climate varies widely between locations influencing such matters as the nature of available vegetation species and the types of wildlife that may need to be considered. Equally how remote or integrated airports are with urban or developed environments and their linkages are all individual. It is therefore understandable that there are no internationally recognised quality criteria around greening or standards for planting

within airports. However, upon evaluating the case studies several general design objectives can be identified that are applicable to the majority of the case studies and these are summarised in *Table 1.2* below.

Table 1.2 Case Study Design Objectives

Design Objective (in order of case study)	26 Global Airports	Brisbane Airport	Singapore Terminal 3	Edmonton Airport	Schipol	LAX Northside	Applicable to 3RS
Use of landscape to mitigate air, soil and water pollution	✓	✓	n/a	✓	✓	×	✓
Manage risk to operations from birdlife	✓	✓	✓	✓	✓	✓	✓
Landscape design and visual quality: • enhance the airport's appearance • create an attractive and innovative landscape setting for the enjoyment of the community • balance the airport's built-form and complement biodiversity values by encouraging connectivity between biodiversity and landscape • create a welcoming gateway to the airport • provide opportunity for passive outdoor recreation • maintain landscape at all times • Design visual corridors are kept open for people to enjoy take off and landings	✓	✓	✓	✓	✓	✓	✓
Conversion of airports into sites for urban agriculture, renewable energy and urban development to enhance environmental quality	✓	×	×	×	×	×	×
Maximises internal landscapes within terminal buildings	×	×	✓	×	×	×	✓
Select planting species that doesn't attract wildlife, are characteristic of the local micro-climate and are economically feasible and cost-effective to maintain	✓	✓	✓	✓	✓	✓	✓
Minimise adverse environmental impacts minimising, for example, manage water use and stormwater runoff; use of low impact development techniques	✓	✓	✓	✓	×	×	✓
Create a 'sense of place' by relating landscape design to the unique character of the city	✓	×	✓	✓	×	✓	✓
Maximise "greening" of the airport by use of vegetation throughout the site	✓	✓	✓	✓	✓	✓	✓

It is evident from the case studies that greening and planting opportunities vary considerably according to a facilities' function (e.g. the safety considerations for bird strike when planning for vegetation within an airport), location (urban, rural, inland, by the sea etc.), climate (which in turn affects selection of plant species for planting but also the maintenance requirements), etc. The following text explores the applicability of each of the design objectives to the 3RS.

'Use of landscape to mitigate air, soil and water pollution'; 'Minimise adverse environmental impacts minimising, for example, manage water use and stormwater runoff; use of low impact development techniques'; 'Select planting species that doesn't attract wildlife, are characteristic of the local micro-climate and are economically feasible and cost-effective to maintain'; and 'Maximise "greening" of the airport by use of vegetation throughout the site' are relevant to all airports and therefore directly applicable to 3RS. In particular in Hong Kong where there are frequent typhoons and heavy rainy periods, the consideration of stormwater runoff and management of water use can be integrated into landscape design. Equally the Airport Authority have an approved planting list from which all planting species would need to be selected.

'Manage risk to operations from birdlife' is directly applicable. There is considerable birdlife in Hong Kong and this should be a key consideration when developing the landscape design and plant species.

The 'Landscape design and visual quality' elements listed in *Table 1.2* are all applicable to Hong Kong. In particular all airports should seek to create a welcoming gateway and for the landscape to enhance the airport's appearance and these elements of the objective are echoed in many of the documents reviewed. Given the constraint of land area for the 3RS how much area can be dedicated to providing opportunities for passive outdoor recreation will be more limited but must be developed with the context of Hong Kong standards.

'Conversion of airports into sites for urban agriculture, renewable energy and urban development to enhance environmental quality' is less directly relevant to 3RS given the land area constraint and lack of significant urban agriculture within Hong Kong. While this objective could be included for 3RS, it is not a key consideration and it is considered that other objectives have more direct relevance.

'Maximises internal landscapes within terminal buildings' is particularly relevant in Hong Kong and to the 3RS given the lack of outside space in general. Changi airport in Singapore has gone a long way to developing this objective, appropriately for a city state that aims to see itself as a 'city in a garden', vegetation is everywhere at the airport. 3RS equally could apply it directly to key buildings.

'Create a 'sense of place' by relating landscape design to the unique character of the city' is particularly relevant to Hong Kong and 3RS. Increasing thought is going into the experience that airports offer passengers and as part of this, airports are increasingly aiming to offer a distinctive experience, to make them 'of the place'.

1.5 *RECOMMENDED QUALITY CRITERIA & BROAD BRUSH TARGETS*

A key finding from the case study evaluation was that the landscape and visual designs at airports were developed without reference to a definitive and objective set of global quality criteria, broad-brush targets, or specific international standards. Instead they were developed through a detailed site analysis which established the site's context and existing landscape structures followed by a creative process which sought to exploit the context and structures and devise design solutions which expressed an aesthetic statement supporting the image of the airport's home city as well as fulfilling functional requirements. Within these no doubt local standards and requirements were adhered to but these are not explicitly expressed.

Recognizing there is a high degree of variation in quantified criteria as illustrated by the case of percentage green coverage and in the absence of a definitive and objective set of global quality criteria, broad-brush targets, or specific international standards for airport landscapes, the approach to fulfil the specific element of EP condition 2.18 addressed in this report has been to develop a qualitative set of international landscape design criteria based on the evaluation of the case studies. In addition a set of broad brush targets for greening and planting based largely on relevant local guidelines but recognising some of the targets in the case studies are set out.

In addition, the mitigation measures set out in the EIA with regard to landscape and visual impact will need to be taken into consideration for all Landscape Design works, as well as all relevant local requirements.

1.5.1 *Design Quality Criteria & Broad Brush Targets*

The proposed international design quality criteria and broad brush targets are indicated in *Table 1.3* below.

Table 1.3 Recommended Design Quality Criteria and Broad Brush Targets

#	Design Quality Criteria	Broad Brush Target
1	Create a 'sense of place' by relating the landscape design to the unique character of the site context in Hong Kong	*To be developed in conjunction with the landscape and detailed design of key 3RS buildings (e.g. TRC and T2 Expansion)* • Landscape themes will respond to the specific character and site context of each of the landscaped areas
2	Enhance the airport's appearance through an attractive and innovative landscape setting and the creation of a welcoming gateway on arrival and departure	• *To be developed in conjunction with the landscape and detailed design of key 3RS buildings (e.g. TRC and T2 Expansion)* Landscape themes will be coordinated across the different public exposure zones, with an emphasis on an exciting and attractive welcoming gateway to HKIA
3.	Maximise greening of external open space, including reclamation edge	• Target to achieve around 30% green coverage as far as practicable. Green coverage will include at grade greening, vertical greening, roof top greening, screen planting, indoor planting and airside turf planting.
4	Balance built form by connecting it to the external and surrounding landscape	*To be developed in conjunction with the landscape and detailed design of key 3RS buildings (e.g. TRC and T2 Expansion)* • Ensure interface areas between built form and the external spaces contain landscape hard and soft elements, unless otherwise justified • Integrate building and landscape design so that there is no abrupt boundary between the two environments
5	Maximise internal landscapes within building structures.	• Ensure consideration has been made to integrate greening (e.g. within planters, etc.) within key building structures, where feasible.
6	Minimise adverse impacts on the existing landscape and visual resources	• Compensate felled trees based on a target replacement ration of 1:1 • Requirement that 100% of disturbed areas (e.g. temporary works areas) shall be reinstated
7	Select planting species that are sustainable and do not attract wildlife, are characteristic of the local micro-climate and are economically feasible and cost-effective to maintain	• Ensure the planting species comply with the Airport's Approved Plant Species List • Reduce potable water use for landscaping to a practical, cost-effective minimum, beyond a 12-month establishment period

APPENDIX A

DOCUMENTS REVIEWED

A1. DOCUMENTS REVIEWED

The documents presented in the following table were reviewed as part of the current Report. These are comprised of variety of publically available landscape master plans of airports as well as other documentation including architectural award information and general guidelines concerning airport design and landscaping. These documents are relevant to the current Study, but not selected as case studies in particular as they largely reinforce landscape elements showcased by the selected case studies already.

Table A1.1 Information Sources Reviewed

Title	Link (where available)	Key Information
Ben Gurion International Airport, Lod, 2005 (Israel)	https://asla.org/awards/2005/05winners/068.html	The landscape area is divided into a large site of 65 acres which includes the Interchange and approach roads; and Courtyard-like central garden (5 acres) bounded on one end by the main entrance way and on opposing sides by the two large parking structures. Principles include: • Relate to the agricultural landscape of the surroundings: - Traditional citrus groves and agricultural fields. Done by planting new citrus groves on a massive scale (4,500 grapefruit and orange trees) in rows on a grid with no groundcover and plowed annually. - Sculpt areas between adjacent roads and ramps by moving quantities of soil, to create a continuous ground surface in spite of the complex topography • Low maintenance Landscape • Vegetation to suit the climate of the area. ie low water consumption was necessary at this location • Use of water in a traditional Mediterranean way, running in narrow channels with short falls. • Local materials – limestone used in both the paving and the walls with different dressing types for specific effects • Collaboration with local authorities - Forestry Commission provided early-stage management assistance with thinning, control of white-tailed deer and other nuisance species, nutrient and irrigation programmes - Working with local partners to plan and establish an non-profit organization to maintain mature trees. Local farmers maintain the newly planted citrus groves in exchange for fruit
Jandakot Airport Landscape Design Guidelines, 2013 V2 (Western Australia)	http://www.jandakotairport.com.au/images/files/Environment/Jandakot%20Airport%20Landscape%20Design%20Guidelines.pdf	Simple guidelines providing key plant lists to ensure they are indigenous to the area, native to Australia and some approved non-native water-wise plants. Landscaping areas are separated into Streetscapes, Verges, Building Setbacks, and Special Consideration for Leases Adjoining Air movement Areas.
Suvarnabhumi Airport, (Thailand)	http://www.archdaily.com/772509/passenger-terminal-complex-suvarnabhumi-airport-jahn	The focus of design for this airport has been on hardscape features such as careful shading of structures by trellises and provision of a low-energy building, maximizing the use of natural light.

Title	Link (where available)	Key Information
Design Manual for Washington Dulles International Airport – Airport Design Standards and Signing Guidelines, 2010 (USA)	http://www.mwaa.com/sites/default/files/archive/mwaa.com/file/IADVol12010.pdf	Landscape Guidelines within this Design Manual focus on facilitating the following key features: 1. Design of Plantings: Design of plantings within developed landside areas. 2. Preservation and Promotion: Preservation and promotion of the health, safety, and general welfare of the public and employees. 3. Convenient, Attractive and Harmonious; Creation of a convenient, attractive, and harmonious landside airport campus. 4. Preservation and Enhancement: Preservation and enhancement of the Saarinen-Kiley historic Main Terminal environs. 5. **Conservation of Natural Resources:** Conservation of natural resources including adequate air and water quality and the **appropriate use of land**. 6. Reduction of Harmful Effects: Result in the reduction of the harmful effects of wind and air turbulence, heat and noise, and the glare of motor vehicle lights. 7. Preserve Underground Water Resources: Preserve underground water resources and permit the return of precipitation to the ground water strata. 8. Drainage: Act as a natural drainage system and ameliorate storm water drainage problems. 9. Carbon Dioxide: Reduce the level of carbon dioxide and return pure oxygen to the atmosphere. 10. Soil Erosion: Prevent soil erosion. 11. Shade: Provide shade.
Pitking County Airport Landscape Master Plan, Aspen, Colorado, 2009 (USA)	https://aspenairport.com/sites/default/files/Pitkin%20County%20Airport%20Landscape%20Master%20Plan.pdf	

Title	Link (where available)	Key Information
Aviation Landscape and Sustainable Design Criteria, Engineering Department, Port Authority of NY & NJ, 2011 (USA)	https://santabarbaraca.gov/sites/default/files/documents/Services/Design%20Guidelines/Airport%20Design%20Guidelines.pdf	The goal of the guidelines is (1) energy conservation and efficiency; (2) conservation of water and other natural resources; (3) waste reduction; and (4) healthy indoor environments. Breaks landscaped areas into five key areas: (a) Building Sites; (b) Primary Entrance/ Exit; (c) Roadways; (d) Secondary Roadways; (e) Airside; and (f) Tenanted spaces. It also stipulates that landscape design least likely to attract birds should have the following qualities: 1. Avoid plant material and design features that provide birds with a source of FOOD, WATER, COVER and SPATIAL DOMAIN. 2. Canopy trees should be planted in linear rows, **canopies spaced 15-20 feet apart at maturity. (Adjacent canopies should never be touching)** 3. Shrubs and small trees should be used moderately and not be planted under or directly adjacent to canopy trees. (Avoid creating eco-diversity) 4. Shrub beds should be small in size and discontinuous. 5. Flowering ornamental trees should be limited in quantity. 6. Groundcover should be well manicured, healthy, dense, moderately tall lawn, a fruitless low growing groundcover, gravel or bark mulch. 7. All plants should be planted at the same size and time.
Greenville Spartanburn (GSP) International Airport Landscape Master Plan, South California 2016 (USA)	https://gspairport.com/wp-content/uploads/2021/03/Landscape-Final-Document.pdf	Separates the GSP into distinct areas ie Terminal Approach; Terminal Mall; Terminal Drop off; and Airside Garden and is working to improve landscape including tree replacement to diversify away from a historic monoculture on the campus with two main species; improving roads with an effort to plant and maintain a mature tree canopy over the roadways and parking areas, enhance campus greening. There are no specific quantified goals however with the exception of: - a mixture of colours and heights shall be used, and turf relief areas mixed into the plan at a 50% ratio. - automatic irrigation system providing 100% coverage of maintaining lawn and landscape areas in healthy condition. Water conserving systems are encouraged

Title	Link (where available)	Key Information
Architectural and Urban Design Guidelines for the Airport, Santa Barbara City Council, California 1998 (USA)		Includes Area-wide Guidelines for A. New Development; B. Historic Buildings; and C. Landscaping. For Landscaping these include: 1. Landscaping shall serve as a significant unifying element. 2. Major entry announcements at the Airline Terminal and along Hollister Avenue should be achieved with skyline trees. Landscaping should be used to complement the entrance to the Airport, both in the immediate area of the Airline Terminal and along James Fowler Road and William Moffett Place. Landscaping and tree heights may be restricted within the Airport Approach Zones. 3. Landscaping should be generally formal, compatible with existing on-site landscape and the neighborhood and complement the project's design and architecture. 4. Landscaping shall be simple and accent the walls as a sculptural element or color accent. 5. To the maximum extent feasible, storage, utility and parking areas shall be screened with fences, solid walls or landscaping along public rights-of-way. 6. Use landscaping in parking areas and along roadways to mitigate building mass from adjacent access roads. 7. Parking areas should incorporate canopy trees. However, tree height must not conflict with parking lot lighting or Federal Aviation Regulations. 8. The pedestrian environment shall be enhanced with suitable ground cover and low to medium shrubs. 9. All new landscaping shall be of the drought tolerant, low water using and low maintenance type with an emphasis on California native plant materials; irrigation systems are encouraged where appropriate. This requirement may be altered to the degree necessary for use of reclaimed water. 10. A buffer strip, a minimum of 100 feet in width, shall be maintained in a natural condition on the periphery of all wetland communities and creeks. Native vegetation shall be planted and maintained in this setback wherever feasible. 11. Promote a pedestrian friendly atmosphere by providing landscaping and pedestrian connections to surrounding areas, where appropriate.

Title	Link (where available)	Key Information
Logan International, Boston (USA)	https://www.hok.com/projects/view/boston-logan-international-airport-terminal-a/	In 2006 this airport became the first US airport to receive LEED certification, largely due to a major overhaul if one of its terminals (Terminal A). The primary focus for achieving LEED certification, however, was not focused on landscaping but rather on a roofing membrane feature, paving designed to reflect heat from the building, special storm water filtration devices removing suspended solids and total phosphorous from runways and a daylight strategy balancing drawing natural light and preventing glare. More recently (2015) the airport has drawn up a Sustainability Management Plan but again this has limited focus on landscape. Goals and KPIs are separated into ten categories (Energy and Greenhouse Gas Emissions; Water Conservation; Community, Employee and Passenger Well-being; Materials, Waste Management, and Recycling; Resiliency; Noise Abatement; Air Quality Improvement; Ground Access and Connectivity; **Natural Resources**; and Water Quality/Stormwater. KPIs related to landscaping include - Water Conservation: 'reduce landscaping water use by 10% by 2016' - Natural Resources: 'None'. The report simply states that mitigation must be implemented as per project requirements and the quality of nearby natural resource areas maintained/ expanded. In addition, with regards to Community, Employee and Passenger Well-being, a landscaped waterfront park well-suited for picnics, walks and scenic views of the harbor have been developed as well as a features playground, large open lawns and a community garden, but goals related to these features are not directly linked to greening or landscaping and rather focus on employee engagement/ retention/ hire and contribution to local economy.
NEWS: A tender has been floated for soft landscaping at the Abu Dhabi Midfield Terminal Building, 2015 (Abu Dhabi)		Soft landscaping is to be integrated with primary and secondary road infrastructure servicing for all Midfield Terminal Complex (MTC) operations ie part of the greater MTC development.

Title	Link (where available)	Key Information
Chicago Dep. of Aviation *Sustainable Airport Manual* including *Section 02905 Sustainable Airport Landscaping* (USA)		The Sustainable Airport Manual (SAM) has been created by the Chicago Department of Aviation (CDA) to incorporate and track sustainability in administrative procedures, planning, design and construction, operations and maintenance, and concessions and tenants with minimal impact to project schedules or budgets. The SAM not only guides the implementation of sustainability initiatives at O'Hare and Midway International Airports, but is reportedly used by several other airports around the world. Generally the SAM has thresholds and guidance that focus on: Site Selection; Stormwater; Reduction of Heat Islands, roof and non-roof; Water Efficiency; Energy Efficiency, Equipment and Appliances; Generation and/or Integration of Renewable Energy; Green Power; Materials and Resources; Waste Management and Recycling; Recycled content of materials; Use of Local/Regional Materials; and Alternative Fuels/Vehicles. ie Landscaping is not explicitly included but the thresholds for some areas are relevant. Within 'Reduction of Heat Islands' examples include green roofs, green walls and minimizing paved surfaces. Within 'Water Efficiency' the use of native, drought tolerant landscaping to minimize maintenance and irrigation needs is recognized in helping to achieve the reducing of potable water resources by 40%. The *Sustainable Airport Landscaping* section of the SAM is prepared as a general guideline and is not for a Specific Project. It defines landside areas as including 'all public and private roadways and buildings that are not within the Aircraft Operation Area (AOA) which is delineated by the perimeter security fence'. Sustainable design categories are focused around Construction Activity Pollution Prevention; Stormwater Design; Landscape & Exterior Design to Reduce Heat Islands (Non-Roof and Roof); Water Efficient Landscaping; and Innovation in Design/Construction. Landscaping criteria within the document are centered around ensuring plants are (1) native and (2) do not attract birds and/or mammals where relevant; (3) tolerate dry soil conditions and (4) are low-maintenance particularly in areas where aesthetics will play a larger role such as terminals, roadway approaches to the Airport, occupied buildings/ facilities and other areas of high visibility to the public. In addition guidance is provided regarding where trees can be planted (ie not within the Aircraft Operation Area), minimum plant spacing and maximum heights (no greater than 6 feet tall) and buffer distances to active runway or taxiways. (not within 600') Acceptable landscape elements for use include but are not limited to: Landscaped earthen berms or terraced flower beds; Raised planters, planter boxes, and containers; Hanging baskets; Free-standing trellises less than six feet above grade; Decorative stones or pavers; Benches and seating areas; Vine-covered retaining or free-standing walls less than four feet above grade; Ornamental fences.

Title	Link (where available)	Key Information
Transport Canada –TP 13549 - Sharing the Skies, Ch8 Solutions-Airport & Surroundings, 2010 (Canada)		With regards to the overlap of landscaping and safety concerns around bird strike and other wildlife, this document notes "It is the policy of Transport Canada to regard all wildlife on airports as potential hazards to airport and aircraft safety, and to site, construct, maintain, and operate the airport and its facilities in a manner that will minimize these hazards". A number of points are noted: • Effective programs encompass the entire airport, including buildings and structures but focus on aircraft-movement areas and approach and departure paths regardless of an airport's size. • Passive measures concerning wildlife including control of airport features that attract wildlife ie set out to reduce availability of food, water and shelter to ensure facilities are least attractive to wildlife. Examples measures include: - remove tree stand to eliminate roosting or nesting sites for birds etc.; - ensure adequate drainage to ensure no standing water areas; - increase slope of banks to eliminate shelter areas. • Suitable maintenance to ensure new habitat remains unattractive to problem species for an extended period of time. There is some debate around maintenance of grass – some suggest keep short to reduce loafing and feeding, others suggest long grass make it more difficult for birds to find food such as insects and reduces their visual contact with surrounding environments to inhibit their ability to detect predators. • Active measures including scaring and harassing wildlife to disperse.

APPENDIX B

FURTHER DETAILS OF INTERNATIONAL & LOCAL STANDARDS REFERENCED

B1. STANDARDS REFERENCED

Further details of international and local standards referenced in the main report are provided in this Appendix.

1.1 LEED

This is the accreditation scheme of the US Green Buildings Council (USGBC) and was developed to address all buildings everywhere, regardless of where they are in their life cycle. While it was developed by USGBC, it is used internationally with over 40 green building councils forming the LEED International Roundtable, an advisory group looking to supporting USGBC in advancing LEED worldwide and including Hong Kong and China (represented by a not-for profit organization 'Platinum'), Korea and India amongst others.

LEED has assessment tools focused on: Building Design and Construction; Operations and Maintenance; Interior Design and Construction; and Neighbourhood Development with specifications according to building type within those, but nothing specifically for Airports. Most relevant to greening and planting are some for the assessment criteria within 'LEED for Building Design and Construction' and 'LEED for Neighbourhood Development'.

1.1.1 LEED for Building Design and Construction

LEED for Building Design and Construction includes:

- **Water Efficiency: Outdoor Water Use Reduction** requires certain projects to reduce their landscape water requirement by at least 30% from the calculated baseline for the site's peak watering month. Reductions must be achieved through plant species selection and irrigation system efficiency, as calculated by the Environmental Protection Agency (EPA)'s Water Sense Water Budget Tool. Points are earnt as follows:

  - 2 points (1 point if healthcare), where no irrigation is required by showing the landscape does not require a permanent irrigation system beyond a maximum two-year establishment period;

  - 1-2 points (1 point if healthcare) if reducing a Project's landscape water requirements by at least 50% from the calculated baseline for the site's peak watering month (30% for Neighbourhood Development).

- **Sustainable Sites, Heat Island Effect (Roof and non-roof)** requires certain projects to minimize effects on microclimates and human and wildlife habitats by reducing heat islands and this can include provision of a vegetation roof, use of existing plant material or installation of plants to provide shade over paving areas (install vegetated planter) on the site within 10 years of planting. No specific criteria are provided as to the minimum area required etc. however.

1.1.2 *LEED for Neighbourhood Development*

LEED for Neighbourhood Development includes provision for minimum garden space by project density as detailed in *Table B1.1* and some quantitative measures for tree planting as detailed below.

Table B1.1 Minimum garden space, by Project density

Project Density (DU/hectare)	Growing Space (sq. meters/ DU)
> 17.5 and ≤ 35	18.5
> 35 and ≤ 55	9
> 55 and ≤ 69	7.5
> 69 and ≤ 87	6.5
> 87	5.5

- 1 point for tree-lined blocks where trees are provided at intervals of no more than 12m (exempting driveways) along at least 60% of the total existing and planned block length within the Project

- 1 point for provision of shade from trees or permanent structures over at least 40% of the total length of existing and planned sidewalks within or bordering the Project. Trees must provide shade within 10 years of landscape installation.

1.2 *CEEQUAL*

CEEQUAL is an UK accreditation scheme originally named '*Civil Engineering Environmental Quality Assessments and Awards Scheme*' but more recently updated to *'Sustainability Assessment, Rating and Awards Scheme for Civil Engineering, Infrastructure, Landscaping and Public Realm*[(1)] *Works*'. CEEQUAL-trained Assessors use this self-assessment process to assess projects or contracts and there is an International Manual for projects anywhere in the world. CEEQUAL has been used in UK, Hong Kong and Sweden and was also recently in talks with Malaysia's Sustainable Construction Excellence Centre (MAMPAN), a division of the Construction Research Institute of Malaysia (CREAM).

CEEQUAL includes nine sections in the Assessment Manuals covering: Project Strategy; Project Management; People and Communities; **Land Use and Landscape;** the Historic Environment; Ecology and Biodiversity; Water Environment (fresh and marine); Physical Resources Use and Management; and Transport. Within the Land Use and Landscape, relevant considerations that can earn credits are:

- whether the landscape proposals go beyond the aims of applicable landscape development or enhancement policies published by the relevant local, regional or national authority.

(1) 'Public Realm' is a term used to describe the spaces between buildings in built-up areas, where works on roadways and footways, pedestrianised areas, hard and soft landscaping and open spaces is undertaken

- what percentage of vegetation (of any kind) of high or moderate quality has been retained as part of the design. If retention is under 25% there is no credit given while 25-50% is the minimum scoring, with increments at 50-75%, 75-90% and 100%;

- whether planting design has taken the appropriateness of species selection into account to include factors such as climate adaptation, local provenance and soil stability;

- whether a long-term management plan is in place that defines long-term landscape objectives, established recommendations for work required to ensure those objectives are achieved and sets a programme for ongoing monitoring and review to assess the effectiveness.

Other than the first point, no quantitative criteria are suggested. Other considerations that are also not quantified include:

- whether there is evidence that landscape and visual factors have been considered by a suitably qualified landscape professional at each stage of the Project.

- whether there is evidence that the project design fits the local landscape character in terms of landform/ levels' materials; planting; style and detailing; scale; and landscape or townscape pattern;

- whether the impact of the development on the landscape character of the areas has been assessed, if the Project is located in an area of acknowledged and/or protected high amenity value for its landscape,. Coastal or townscape character;

- whether a system or plan was implemented during construction to ensure: commitments were implemented, beset practice applied for planting or habitat areas to avoid damage to landscape features, and soil conditions met the requirements for successful establishment of the landscape design.

1.3 BEAM PLUS

BEAM Plus is an accreditation scheme which has been set up by the Hong Kong Green Building Council Limited (HKGBC), a non-profit, member-led organisation established in 2009. Since 2012 HKGBC has been an Established Member (highest level of membership) of the global network organised by the World Green Building Council (WorldGBC) and joined the WorldGBC Directorship from July 2013 to June 2016. HKGBC strives to promote the standards and development of sustainable buildings in Hong Kong and develop practical solutions for Hong Kong's unique, subtropical built environment of high-rise, high density urban area.

HKGBC has developed various Building Environmental Assessment Methods (BEAM) to undertake assessments and covers the demolition, planning, design, construction and commissioning of a new building project and can also be applied to major renovations, alterations and additions. Overall it seeks to reduce the environmental

impacts of a new building while also improving environmental quality and user satisfaction. Assessment Aspects include: Community Aspects (CA); Site Aspects (SA); Green Building Attributes (GBA); Management (MAN); Materials and Waste Aspects (MWA); Energy Use (EU); Water Use (WU); Indoor/Outdoor Environmental Quality (IEQ/OEQ) and Innovations and Additions (IA). Assessment criteria relevant to landscape and greening are included within SA categories of BEAM Plus *New Buildings* (although this is regarding residential buildings), with provisions around green and open space (which may be partly be used for greening), in *Neighbourhoods*.

BEAM Plus – New Buildings v1.2 – SA7 Landscaping and Planters

For residential premises with site area larger than 1,000 m^2, it is required to demonstrate compliance with appropriate planting on site equivalent to at least 20% of the site area.

- 1 credit is awarded for providing appropriate planting on site equivalent to at least 30% of the site area.
- 2 credits are awarded for providing appropriate planting on site equivalent to at least 40% of the site area.
- 1 credit point is awarded for using previous materials for a minimum of 50% of hardscaped areas.

BEAM Plus – Neighbourhoods v1 - SA2 – Accessibility to Open Space, Greenspace and Blue Assets:

- 1 credit point is awarded where the two conditions are met:
  - (i) the total aggregate area of Open Space, natural woodland, shrub land, grassland, wetland and water bodies within the Assessment Area (Site Area and Impact Area combined) exceeds 5% of the Assessment Area; and
  - (ii) There is a pedestrian access not exceeding 500m walking distance that connects the above spaces to a notional entrance of any major occupied building within the site.
- 1 credit point is awarded where the two conditions are met:
  - (i) the site provided a total aggregate area of Open Space, Green Space and blue assets exceeding 5% of the Assessment Area; and
  - (ii) The Open Space, Green Space and blue assets provide a reasonable access by the public
- 1 credit point is awarded where:
  - (i) Open Space, Green Space and blue assets within the Site exceeds 5% of the Site Area; and

- (ii) At least one shaded or covered pedestrian route to Open Space, Green Space and blue assets is provided within the Site.

A number of credit points are also associated with ecological value and may be linked to landscape strategy but are not directly relevant to greening for landscape and visual purposes.

BEAM does allow for refinement of criteria according to specific conditions and none of these credits are geared towards aviation facilities and for 3RS, as certain types of landscaping and greenery provide food or shelter that attract birds in the aerodrome and may increase the risk of bird hazard, it is considered that the scale of soft landscaping would need to be controlled for safety reasons and the percentage thresholds listed above for credit requirements may need to be reduced. To maximize the provision of greenery, however, internal landscapes could be provided where possible, to improve the indoor environmental quality and visual benefit of occupants within 3RS.

ANNEX C

Generic Tree Protection Plan

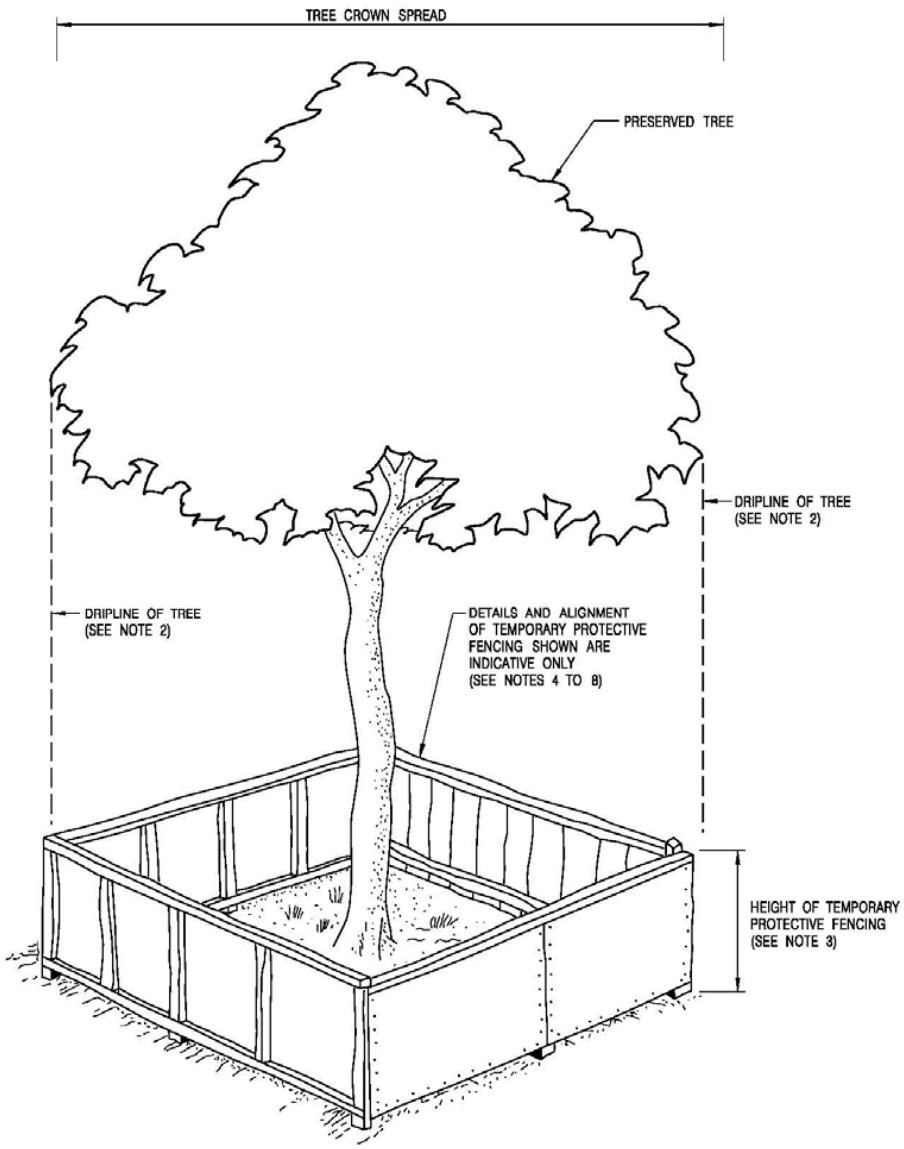

PLAN – INDIVIDUAL TREE
(DIAGRAMMATIC)

PLAN – GROUP OF TREES
(DIAGRAMMATIC)

TEMPORARY PROTECTIVE FENCING TO PRESERVED TREE	**DRAWING NO.** TP1 (SHEET 1 OF 4)

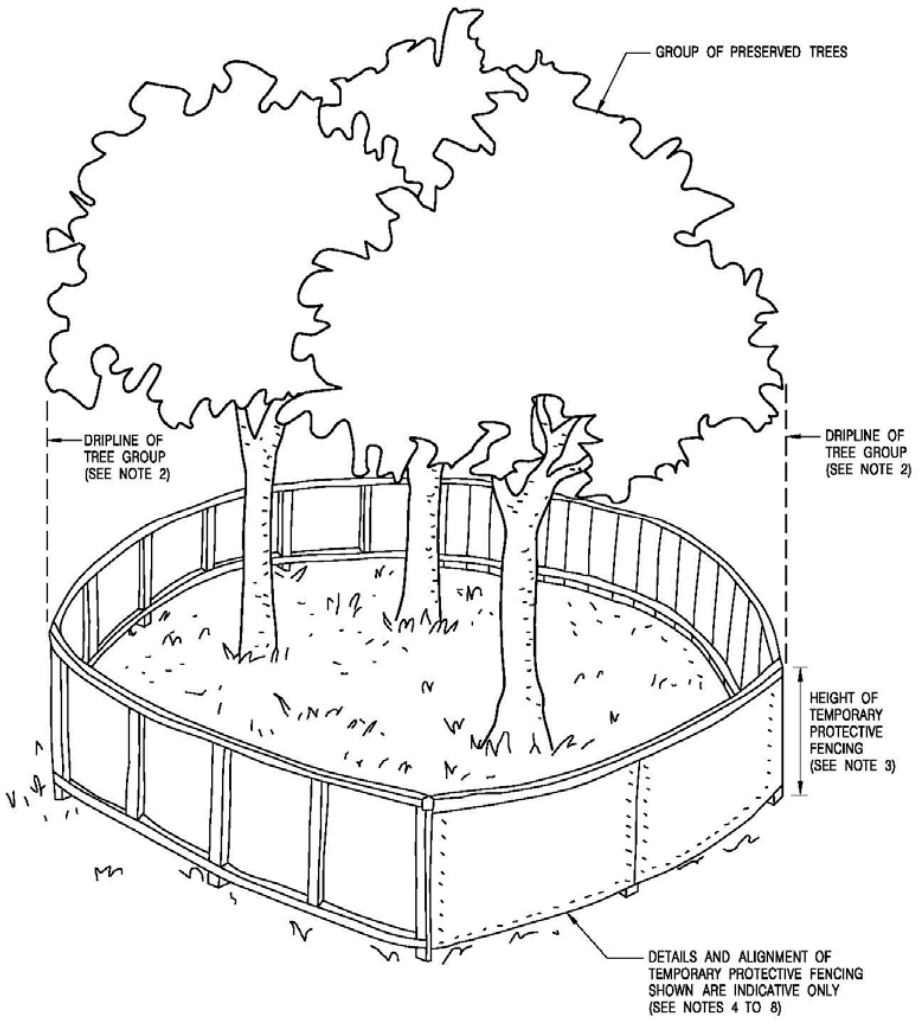

PERSPECTIVE – INDIVIDUAL TREE

(DIAGRAMMATIC)

TEMPORARY PROTECTIVE FENCING TO PRESERVED TREE

DRAWING NO.
TP1 (SHEET 2 OF 4)

PERSPECTIVE – GROUP OF TREES

(DIAGRAMMATIC)

TEMPORARY PROTECTIVE FENCING TO PRESERVED TREE	**DRAWING NO.** TP1 (SHEET 3 OF 4)

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES UNLESS OTHERWISE SPECIFIED.
2. DRIPLINE OF *TREE / TREE GROUP EXTENDS TO THE OUTERMOST BRANCHES OF THE *TREE / TREE GROUP, DEFINING THE PERIMETER OF THE *TREE PROTECTION ZONE / AGGREGATE TREE PROTECTION ZONE.
3. HEIGHT OF TEMPORARY PROTECTIVE FENCING SHALL BE 1500 MINIMUM, BUT THE REQUIRED HEIGHT SHALL BE DETERMINED BY THE *ARCHITECT / ENGINEER / SUPERVISING OFFICER WHEN APPROVING THE CONSTRUCTION DETAILS OF THE FENCING AS REFERRED TO IN NOTE 8.
4. TEMPORARY PROTECTIVE FENCING SHALL BE STRONG AND APPROPRIATE FOR RESISTING THE IMPACTS OF CONSTRUCTION ACTIVITIES ON THE SITE. IT SHALL BE MADE OF ROBUST MATERIALS AND SHALL COMPRISE A VERTICAL AND HORIZONTAL SCAFFOLDING FRAMEWORK, WELL BRACED AND SUPPORTING **CHAIN LINK FENCING / STEEL SHEET FENCING, OR OTHER FENCING AS APPROVED BY THE *ARCHITECT / ENGINEER / SUPERVISING OFFICER. ONLY IN EXCEPTIONAL CIRCUMSTANCES SHALL PLASTIC WEBBING BE CONSIDERED.
5. THE ALIGNMENT OF TEMPORARY PROTECTIVE FENCING CAN BE IN CIRCULAR, SQUARE, RECTANGULAR OR ANY OTHER SHAPE SO LONG AS THE FENCING INCLUDING ITS FOUNDATIONS DOES NOT ENCROACH INTO THE TREE PROTECTION ZONE.
6. A LOCKABLE GATE SHALL BE PROVIDED TO THE TEMPORARY PROTECTIVE FENCING TO ALLOW ENTRY FOR CARRYING OUT THE NECESSARY ARBORICULTURAL WORKS OR MAINTENANCE WORKS TO THE TREE OR ANY OTHER APPROVED WORKS WITHIN THE TREE PROTECTION ZONE.
7. WARNING NOTICE GUARDING AGAINST UNAUTHORISED OPERATIONS WITHIN FENCED AREA SHALL BE ERECTED ON THE TEMPORARY PROTECTIVE FENCING.
8. THE CONTRACTOR SHALL SUBMIT THE CONSTRUCTION DETAILS OF THE TEMPORARY PROTECTIVE FENCING TO THE *ARCHITECT / ENGINEER / SUPERVISING OFFICER FOR APPROVAL PRIOR TO ERECTION OF THE FENCING.

* DELETE WHICHEVER IS INAPPROPRIATE.

** DELETE WHICHEVER IS INAPPROPRIATE. STEEL SHEET FENCING SHALL BE USED IN CIRCUMSTANCES WHERE THE CONCENTRATION OF CONSTRUCTION ACTIVITY IS PARTICULARLY INTENSE OR THE PRESERVED TREE IS EITHER PARTICULARLY VALUABLE OR PARTICULARLY VULNERABLE.

TEMPORARY PROTECTIVE FENCING TO PRESERVED TREE	**DRAWING NO.** TP1 (SHEET 4 OF 4)

In addition to the general notes, which support the generic tree protection plans provided above, the responsible parties for the implementation and maintenance of these measures including their regular checking are also summarized below as per the requirements set out in the EM&A Manual.

Stage	Monitoring Task	Monitoring Report	Form of Approval	Frequency
Detailed Design	Checking of design works against the recommendations of the landscape and visual impact assessments within the EIA shall be undertaken during detailed design and tender stage, to ensure that they fulfil the intention of the mitigation measures. Any changes to the design, including design changes on site shall also be checked.	Report by AAHK/ PM confirming that the design conforms to requirements of EP.	Approved by Client	At the end of the detailed design phase
Construction	Checking of the contractor's operations during the construction period.	Report on Contractor's compliance, by ET	Counter signature of report by IEC	Weekly
Establishment Works	Checking of the planting works during the 12-month establishment period after completion of the construction works.	Report on Contractor's compliance, by ET	Counter signature of report by IEC	Every two months
Long Term Management (10 year)	Monitoring of the long-term management of the planting works in the period up to 10 years after completion of the construction works.	Report on compliance by ET or maintenance agency as appropriate	Counter signature of report by Management Agency	Annually

Source: Table 12-1 of Updated EM&A Manual

Landscape & Visual Mitigation Measure ID No.	Implementation Agency	Management Agency	Maintenance Agency
Construction Phase			
CM1 – CM10	Contractor	-	-
Operation Phase			
OM1, OM5, OM8, OM10, OM11	Design Engineer	AAHK	AAHK
OM2 – OM4	Design Engineer	Building Operator	Building Operator
OM6, OM7, OM9	Contractor	AAHK	AAHK

Source: Table 12-2 of Updated EM&A Manual

In accordance with the EM&A Manual, construction mitigation measure **CM8**, which states that: "All existing trees shall be carefully protected during construction. Detailed Tree Protection Specification shall be provided in the Contract Specification. Under this specification, the Contractor shall be required to submit, for approval, a detailed working method statement for the protection of trees prior to undertaking any works adjacent to all retained trees, including trees in contractor's works areas" shall be implemented by the Contractor, and monitored by the ET on a weekly basis. The ET shall also be responsible for reporting on the Contractor's compliance, with the report to be counter signed by IEC.

ANNEX F

Typical Tree Transplantation Specification

GENERAL REQUIREMENTS FOR TREE TRANSPLANTATION WORKS

1. SUBMISSION OF METHOD STATEMENTS

1.1 The Contractor shall make his own arrangements for the transportation of trees. The Contractor shall submit the method statement for tree transplantation to the Project Manager/ET/IEC for review without objection prior to the commencement of any works. The method statements shall outline the method, sequencing, time of operations and the location and type of machinery to be used for various transplantation operations.

1.2 The Contractor shall allow the tree transplanting works in his programme of Works in such a way that the root pruning to the approved size of rootball shall commence as early as possible so as to ensure maximum fibrous root growth before the transplanting operations.

1.3 The Contractor shall take all necessary precautions to ensure that no damage is done to the tree during all processes of transplanting.

1.4 Transplanting operations shall be timed so as to enable transplanting of the trees direct to the areas of proposed planting. No lifting and transplanting operations shall commence until either the receptor sites or the holding nursery are fully prepared as specified. Any tree lifted must be transplanted and watered on the same day.

1.5 Trees shall be lifted carefully to avoid damage to roots and to obtain the approved size of rootball. Roots shall be cut free of ground, not pulled, using a suitable implement to give a clean cut. The rootball should be properly wrapped before lifting. Also trees should not be lifted by the trunk, as this can cause serious trunk injury but by its rootball which should be properly prepared and wrapped.

1.6 All trees to be transplanted shall be wrapped and protected to prevent mechanical damage during lifting and transportation. They shall also be protected against excessive sunlight, wind and drought. Care shall be taken in packing to prevent over-heating with its resultant loss of foliage.

1.7 Trees transplanted direct to the receptor sites are to be planted in accordance with the contract-specific requirements unless otherwise proposed in the Contractor's method statement and reviewed without objection by the Project Manager.

1.8 The Contractor shall be responsible for all the necessary application for the Temporary Traffic Arrangement for the transplantation works.

2. PREPARATION OF TRANSPLANTED TREES

2.1 The contractor shall follow contract-specific requirements of the preparation works for tree transplanting works, including the rootball size, depth of root ball, root ball preparation period, pruning requirement and recipient site for tree transplanting.

3. PLANTING AT RECEPTOR SITE

3.1 The Contractor shall be responsible for identifying and verifying tree recipient sites in relation to the proposed works before the tree transplantation. Where a tree recipient site is found unsuitable, the Contractor shall submit an alternative proposal to the Project Manager for review without objection. Once the underground utilities verification is complete, associated protective measures such as the provision of

root barrier to any transplanted trees which is in close proximity to existing utilities shall be provided to avoid any potential damages.

3.2 Prior to the lifting of the trees, tree pits at their receptor sites shall be already prepared and agreed on site.

3.3 After settlement the top of the root collar shall be level with the surrounding ground level. Backfill in layers, each layer being firmly consolidated to eliminate air pockets. The backfilling materials proposed by the Contractor shall be reviewed without objection by the Project Manager.

3.4 Add fertilizer to the backfilling materials at the rate agreed by the Project Manager. Alternatively, liquid fertilizer may be use as reviewed without objection by the Project Manager. Fertilizer shall be thoroughly mixed with the backfilling materials. Hormone powder may be applied to the rootball and alginates and polymer gels mixed into the backfilling materials in accordance with the manufacturer's instructions if reviewed without objection by the Project Manager.

3.5 Securing and supporting measures for the transplanted trees shall be submitted by the Contractor and reviewed without objection by the Project Manager.

4. POST TRANSPLANTING/ ESTABLISHMENT WORK

4.1 The transplanted trees shall be maintained immediately after transplanting works, from existing location and subsequent Establishment Period for 1 year. Such maintenance shall include all measures necessary to establish and maintain all the transplanted trees in an acceptable vigorous and healthy growing condition until the expiry of the Establishment Period.

4.2 Immediately after transplanting, the base of all the transplanted trees shall be well watered, using enough water to thoroughly soak the rootball.

4.3 Backfill of soil mix to form ground level to match adjacent landform and apply hydroseeding according to the contract-specific requirements.

4.4 Firming up of the transplanted trees and the supporting materials shall be undertaken as necessary during the period and particularly after heavy rain and/or wind.

4.5 Root activator, if instructed, shall be applied regularly according to manufacturer's recommendations.

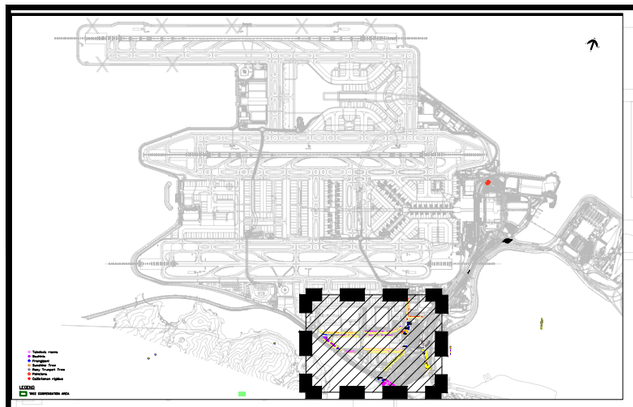

4.6 Rootball shall be kept free of weeds at all times.

*Specific EM&A Requirements:

- In accordance with the EM&A Manual, the ET shall carry out checking of the contractor’s operations during the construction period, which in this case would be the transplanting works. The ET shall also report on the Contractor’s compliance, and the report shall be counter signed by IEC.
- In accordance with the EM&A Manual, the ET shall carry out checking of the planting works during the 12-month Establishment Period after tree transplantation and report on the Contractor’s compliance, and the report shall be counter signed by IEC.
- Following the 12-month Establishment Period for transplanted trees, monitoring of the long-term management of planting works will be carried out by ET or maintenance agency for compliance for a period up to 10 years after completion of the construction works.
